Typical comment from a tech+ who has never spoken to anyone outside of his local area. Luckily, not all 0-landers are this bigotted.

Kevin, I have a 746 and use the "W2IHY DIGITAL VOICE KEYER w/ Built in EQUALIZER and a "BELIEVE IT OR NOT" a Yaesu MD-1 and get excellent reports. With Julius' Voice Keyer and Equalizer you can tailor your audio any way that you want using any mike..... 73 de Dave/N2JBO

As an old Freebander I am not a great fan of some FCC rules but in order to answer your question I will don my Rules are Rules Cap. FCC rules state that any transmitter that can transmit in the 11 meter band (26.965-27.405 mhz) must be type accepted. Ie tested and certified that it follows the rules for 11 meters. So to answer your question. When you either modify a type accepted radio in any way (to make it not factory) or modify a ham transmitter to transmit on 11 meters and transmitt you have broken the law. ******Removing Rules are Rules cap. In the real world who's really gonna give a rat's butt if you keep a clean station and don't create a problem.

N5KBP
Advanced class for now if your wondering. Waiting for new rule making to take 4D and become Class A

Thanks for reading this post. I am looking for a procedure for
calibrating HF SWR and watt meters. I have a good idea on
how to cal. the SWR portion, but the watt meter would require
a calibrated RF voltmeter to read the voltage across the load
resistor. There are RF voltage probes you can build in the
1995 ARRL handbook, but how do you cal. those? I need
a simple standard of some sort. Ideas?

Randy KB8ASO Milan, IN.

I must concur, I have had my ft-50 for a year now, and used it pretty hard almost daily (including a few rare less-than-graceful runs with it on the ski patrol). I've found it to be very sturdy (except for the belt clip, which I replaced with the leather holster and belt loop, which is VERY sturdy). It does NOT do FM broadcast recieve worth a drat, and the stock antenna is easy to improve upon. It has so many features that I spent nearly a month just getting comfortable with using it, although I don't find it very hard to use now that I've had it a while. I would like to compare it to the VX-5, but haven't had the chance. I'm afraid I don't know that much about the other radios on your list, but I spent nearly a year following various opinions of different HTs, and the ft-50 seemed pretty universally popular. I believe the VX-5 has finally had the bugs worked out of the latest models, and these seem pretty popular as well. Good luck!

73,
Chris Happel, KC0CED

Paul, I just left an older but very nice kenwood 440 mobile on trade for a QRP rig at Radio City ((800) 426-2891). They wanted $100 for it, including a remote control head and speaker. It has the optional tone encoder, but the tone can only be changed by re-wiring it internally. The radio was a gift from a relative that was no longer using it, and there is no UHF where I live. I still have the original box and mounting brackets (somewhere... I just went looking for them without any immediate success). I'm afraid you'll have to call them to get more specifics.

Personally, I like the fact that those who
place items on ebay also drop a note here.

It gets my attention and if it something
I am interested in, I go look at it.

the convention of having the [FA} ahead
of a listing here on the newsgroup is
an easy way for those who DON'T like
such postings, to be able to ignore them..

Trish

10. opinion TS870 vs FT1000MP vs IC775DSP

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-01 00:00:00 UTC
From: Gregory E Young <geyoung@acsu.buffalo.edu>
Message-ID: <7e3snu$514$1@prometheus.acsu.buffalo.edu>
Source record: 112085

Hi all:
Am looking to upgrade my hf station to one of the following rigs:
FT1000MP, or IC775DSP, or TS870.
These seem to have the best receivers from each of their respective manufacturers, from what I can determine.
I am located in a very rural area, and have no close stores that will allow me a side by side comparison, unless I drive 12 plus hours to AES.
Even then I would need them side by side on the same antenna.
Any thoughts from those of you that have already researched at least 2 of the above?
If you own one of the above, how do you like it?
Thanks and 73, Greg, KE2VW

You see Mr. Lorentson... you were offerred three times to return the unit and each time you refused... you have never even explained the problem with the rig. You hvae done nothing to resolve this situation , and it is over a year old now.You are erroneous on several of your statements , as I am not "Retired" , the radio was returned to me as "Undeliverable" it was again tested and re-sent to you via UPS at My cost. The radio had been used by myself for SEVERAL years up to and including the day it was packed for shipping.Now a year later, you are

still complaining that I "Ripped you off"... I kindly refer to my 3 offers of you returning it, which in each and every instance you FLATLY refused. Try buying something from Kenwood, Yaesu or even Sears, and demand that they refund your money before you return the item. As far as others who you claim to have received "WARNINGS" about me, please let me know who they are, as I have never refused to correct a situation that was not "Satisfactory"... Also you are in error as far as Claiming that I stated that the radio was repaired by a local radio shop, before I sent it to you. I am the Holder of an ElectoTechnology D.E.C. from Vanier College in Montreal, and I have been a technician for 24 years, and have worked with electronics from uPC controlled Fibre-optic OMR equipment for a National Lottery Corporation, and also have been Department Manager for 3 Electronic Service and Production firms. I DO NOT send equipment out to anyone for repair, I perform the repair myself. Please if you don't wish to reveal the "Others" who gave you input about me , tell them to e-mail me themselves. I will post any and all of those responses here. I have never denied the fact that it may have been damaged in shipping, but I think I would have trouble convincing UPS that it was damaged a year ago when I originally requested that it be returned. Please tell me what options you left me???
Exactly ONE, that I send you back your money for the radio before you would even consider returning it to me. Hardly a workable solution. This is a typical Internet problem, I regularly buy and sell equipment over the Internet, and I understand the risks involved, yes I have had bad experiences and some very good ones, the good ones outweigh the bad by about 100:1.... I also will make the following claim, " I HAVE NEVER WITH FULL or PARTIAL KNOWLEDGE, SOLD A DEFECTIVE PIECE OF ELECTRONICS EQUIPMENT, TO ANYONE UNLESS IT WAS SOLD AS A PARTS UNIT". This goes for your purchase as well as several hundred others. I don't expect to find a solution to this, as I will not accept responsibilty for something that was sold over a year ago, and neither would ANY of the Major Manufacturers,I also asked you what the Repair shop claimed was wrong, and you declined to respond to my request.At this point you have the rig, I feel bad that you have a problem with it, but I have tried to solve this problem with NO cooperation from you, and so I have rescinded my offer for you to return it to me. I think 1 year is plenty of time for you to have done this, and actually when you did not e-mail me for 6 months after I mentioned the Ni-cads would need to be re-charged, I assumed that the problem had been solved. That is all that I have to say about this matter, and it has nothing to do with dealing with someone from outside the U.S , and yes I am still "Working my Trade" and hundreds of satisfied people are quite pleased with the quality of their purchases... They say Buyer Beware, but I also beleive it has become "Seller Beware" also... If I were to express reservations about your intentions, I could conjure up many reasons why you would not return the rig to me, I have no idea what you may have done to it, but until last week , I was willing to trust your integrity, and have you return it. But your refusal to even attempt to resolve this has caused me to become a little concerned. Have a good day and 73 de Jordan...

I have a Knwd 440 and desk mic. MC80 and gotten comments on excellent audio.

I wanted the Heil Pro boom to allow less bending over the mic. I got the pro set, foot and hand switch. All work fine and the foot switch allows me to use both hands. Only a minor complain and that is the cable for the hand switch (a barrel push-button) is about 3 times as thick as the foot switch and thus less plyable. It is great when leaning back in chair and ragchewing though.

16. Which RCI Service Resource Should I Acquire?

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-01 00:00:00 UTC
From: DavidC <davidc@bit-net.com>
Message-ID: <7e08tp$r4$1@news2.bit-net.com>
Source record: 112130

I have learned that I have the following information options:

1. A new Service Manual from Ranger
2. A copy of the Service Manual from a Ham for $14.50
3. The RCI-Bible
4. The RCI-CD

Any recommendations as to my best option? I don't yet know the
cost of the new manual, RCI-Bible, or RCI-CD.

Thanks! & 73, DavidC K1YP

Very nice cond.Tram D201A.It's a solid 7+(most people who see it say it's in "mint cond.") on a 1-10 scale.Has the extended freq.mod.,HI - LOW power mod.,fan kit,and new walnut ends from Maycom.Comes with stock D104 mic and reproduction manual from "Tram Tech".Works perfect and sounds great!! Just dont need three Tram's.Price is $400.00 + shipping. If you need more info,you can email me KF6IKC@webtv.net or call me at (530)241-0843.

Take care,
Stan

Hmm, my RELM MPV32 programs through the front keypad.
Seems legal to me, I do have to push a few button though. Also has FCC Type acceptance.

The newsgroups are for discussion, not for greedy bozos to drop a poopy
for selling their products and then go away.

This particular "richcom" chucklehead seems to think the newsgroups are
his own personal advertising ground. Considering the amount of equipment
he's been selling here and in a spamful of other newsgroups, he's either
a dealer or someone who inherited Barry Goldwater's ham shack.

I have a small quantity of small 3" x 2" microcontroller boards
that I have programmed as beacon keyers.
I will custom program your CW message of virtually any length.
Sends out your CW message at 8 or 12 WPM (selectable) on
a ground-to-key PTT line.
Requires 5vdc (12vdc with an optional regulator).
US $30 post paid each includes hookup documentation.

For more info remove both 'x' in my address to reply.

Near mint 160-10 Meter transceiver with digital display, CW filter,
operator and service manuals. Very low hours...it still has the original
final tubes. No problems, a few documented reversable mods added from
Kenwood and QST hints and kinks. Two BNC connectors added on back to allow
external reciever. Asking $350. Local pickup in the Detroit MI area
preferred. I am the second owner (non smoker) and have had it since early
eighties.

I have a Yaesu FT-8100 about 1.5 years old. The unit has developed a problem. The right hand volume and squelch controls have basically quit working. If you wiggle the volume control around it will sometimes seem to work. The unit seems to work, I can transmit and receive on the right side (440 Mhz) without a problem. You just can not control the volume or squelch.

I was wondering if anyone else had a similar problem?

Thanks for any information in advance.

I think you mean Akihabara, in Tokyo. Yes...best in the world for latest and greatest gear. Often on VHF/UHF gear, the band plans are different (so be careful what you buy to ensure it will work on same freq's as your home country)
Some of the best back in the early 90's were T-Zone and X-One.

As for Hong Kong, I have found a good shop just across the street from the Holiday Inn, Golden Mile just up the street from the Star Ferry Peer in Kowloon.
Good prices. I think it's owned by a Thai man. Just remember when buying in HKG: Caveat emptor -- standard accessories sometimes become "optional" - always do your homework, as a deal too good to be true could come without a rechargeable battery and charger, without microphone etc. Also, check voltages. JA gear runs 100VAC, HK runs 220VAC.

Been there, done that....more than once.

I have for sale the following Communications Loggers:

Quantity 2 (TWO): Stancil Corp - Santa Ana, Ca,
800 series Multi-trac Loggers.
Each unit contains 2 10-840 Decks
1 10-868
Controller
1
07-1747 Pwr Supply
1 Teac
Cassette Deck (stereo)
Serial Numbers: E6-87-xxxxxxx

Quanity 1 (one) Pitney Bowes Corp Dicta Phone Series 9000 Logger
Model 9407 Controllers
2 Tape Decks
This unit has a video display for programming / recording /
playback operations.

Each of these units have installed telco interfaces .
I have a large quanity of tape reels with tape. These units were turned
on and
we played some tapes to insure they are basically working. We did not
take the time to do
any recording. The units are in good condition.

If interested please email me at the above address without the (nospam.
)
you can also reach me at WB4JLD@aol.com

Thanks,
BoBc

I seem to remember that Yaesu made a mobile radio that has DCS (like the FT-50 and VX-1) but I can't remember which one it is. The FT-8500 comes to mind but I can't get the information anywhere.

Could someone who knows this information let me know ?

Thanks

Stay safe !

The hard to find part(s) will be the plug-in coils which determine the frequency range. Now I remember how they could make an all-band rig so small. BTW, the G-66 Rx covers 160, but the twin G77 Tx does not. Just looked at mine on the shelf.

Well, you lucky stiff,
HRO is in Sunnyvale, just off the intersection of Lawrence expressway and Central expressway and there are several good! surplus parts places in the area. Fry's also has a few ham rigs. E-mail me if you're interested in the parts places and I'll try to find my list.

You may not be aware how tenuous the permission to build your own rig is. There have been several moves to remove that liberty and require type acceptance tests of all amateur equipment, home-made or not. I believe the present rules allow you to build two of anything, but beyond that, it becomes a regulated product.
Amateurs who are not involved in the commercial aspects of electronics tend to be very naive about rules and regulations, once they have their license, and make a lot of assumptions which are patently against FCC rules.

>Air Bands if you can help please E-mail me at Dibbosky@aol.com

It will *receive* the air band just fine. If you have it set up to
automatically select receive mode based on frequency, it should even
select AM receive for you. If you've got the auto mode selection turned
off, you'll have to set AM receive manually.

But it will not transmit AM under any circumstances - the circuitry
needed for AM transmit just isn't there.

In the process of buying and swapping filters for a Kenwood R-5000, I have a standard SSB 3 kHz YK 88 S filter left over. Asking $40, or will swap for a YK 88 SN.
I think that in addition to the R-5000, it fits the TS 440 and maybe other transceivers, but check your manuals if interested, as I have no references to those.

Thanks for reading this post. I am looking for a procedure for
calibrating HF SWR and watt meters. I have a good idea on
how to cal. the SWR portion, but the watt meter would require
a calibrated RF voltmeter to read the voltage across the load
resistor. There are RF voltage probes you can build in the
1995 ARRL handbook, but how do you cal. those? I need
a simple standard of some sort. Ideas?

Hello,

I have a "Cushcraft ARX-270 U" dual band (2m/440mhz) antenna for sale in excellent condtion. I have moved from a country location where I needed it to a "in town" location. This antenna is a fiberglass vertical that comes in three sections. It is 16ft total length so you don't have to get it up that far to really get some gain. I used it with a Yeasu FT-50R handheld with 5 watts and was supprised just how far this antenna reaches. It has a shiny white, thick, fiberglass exterior. It has a really heavy duty, thick aluminm base with "U" brackets to connect it to a pole. It comes comes complete with easy to connect SO-239 pigtail. There are also three ariels that protude horizonally from the aluminum base... The quality of this antenna is really something, I have mixed feeling on letting it go... =)

$175.00 - I'll pay shipping UPS COD...

Why is that? I mean, I can, as an amatuer, build my own station (hopefully, I took the time and made sure that the TX side of things were clean enough not to bother anyone else). I would assume that one could also build their own 11m rig (why, I don't know, since you can buy one for $20 or less). So, why would it be wrong to modify one of those types of rigs to cover both bands? As long as one turned down the power on 11m, that is--I beleive it's only 4W AM, 12W SSB down there.

Thanks for the reply.

Hello all,

Does anyone have the following problem with the Yaesu FT8100, and if you do, can it be fixed?
On the LEFT VHF vfo - digits after the decimal point blink and nothing can be received between 201.980 to 205.995 Mhz.

On the RIGHT VHF vfo - digits after the decimal point blink and nothing can be received between 110.000 to 130.850 Mhz and between 169.800 to 247.845 Mhz.

Also, for either of the above, when squelch is turned down, sounds like unit is motor-boating.

thanks for all inputs

Eric,

I chatted with a local ham who said definitely go with the full size; he had tried both.

Ended up with the Pro Set and HC-4 yesterday, mainly because none with HC-5 were in stock. I'll change it later if need be. But I am glad to hear you like the TX audio with the HC-4.

The best approach of all is to locate someone who has a Bird Model 43 wattmeter that you can borrow for a day or two.
Just be sure the Elements are correct for the frequency range that you are interested in.

Source record: 111984

I installed mine into a 1995 Grand Marquis. The remote head is up above the rear view mirror. The speaker is behind my left ear - mounted just above the door jamb between the two doors. The mic clip is on the front panel.

So,

1) it is discrete
2) speaker is close to my ear and I don't annoy anyone else with radio blasting
3) Control panel is at a place I don't have to shift my eyes very far to see.

I like it. (I never would have done it, except my wife actually installed it after I swore a few times about how impossible it was and how I was just going to throw it -- she did a damn good job deciding how to position each component.

oh. p.s. the radio itself is in the trunk -- turns out there are good power wires back there that Ford put in for those megawatt stereo boom amplifiers. Just used that -- trunk mount antenna with a 6 foot lead that fits right to it.

(If it is hard to visualize, let me know if you are interested and I'll take a few quick snapshots and send the JPEG files and you can see what I was talking about.)

cheers

Rick W4RP

Re the error due to forward voltage drop and non linearity under and around the point of conduction for Germanium and Silicon diodes, anyone know if its workable to set a steady DC current through the diode so that it is well in to conduction. Would this enable one to measure very low RF voltages below the forward Voltage level of the diode and improve linearity ??

Hello All,
I recently bought an IC746 from a well respected main dealer
in UK and found it to be faulty. The power output into a 50 ohm power
meter/dummy load varied from about 2W on 160M to about 25W on 20M then
dropped off again towards 10M.

I contacted the dealer who immediately said - abridged - "Very sorry,
have another one."

I got my second 746 home and found it took a few seconds to burst into
life after the Power button was pressed. This got progressively worse
until, after a week, it was taking the synthesizer half an hour to lock
on from cold.

I contacted the dealer who said - abridged - "Very sorry, most unusual,
we'll test another new one out on the bench and swap it for you."

My third brand new IC746 now seems to being working perfectly after two
weeks of 'burn in'. I am still pleased I bought that model as I think
it offers a relatively good package for the money in an amateur radio
context.

Furthermore I'm delighted with the service I received from Martin Lynch
& Sons and it would give me great peace of mind to buy from them again.

BUT I now have a niggling doubt at the back of my mind - How long is
this one going to last? I appreciate we are talking about 'consumer
grade' electronics here but two brand new faulty units in a row? Is/was
there a quality control problem at the factory with this model?

But hey, maybe I'm just being paranoid - unless of course _you_ know any
different ....

73

Mr Lucky ;-)

The post is positive. Look in either the instruction manual, or on the recharger; they both should tell which way it goes. By the way, it does have protection on it, or at least mine did; when I wired it up backwards (for some reason, whenever it comes to hooking up power leads, I always always do them backwards) radio worked as per usual off the battery, and the voltage stayed the same. [On my FT-50, I turned on the battery voltage so as to monitor battery life easily.]

I need help identifying an Icom HT battery. It says Icom (black with brown letters) on the front sticker located in the lower left hand corner. It does not have the pack model number on it anywhere. I need to buy a new NiCad insert for it. The pack has a port for the wall charger and a port for 13.8 VDC along with a small LED to indicate charging. The inside has 11 - 750 Mah cells inside the case along with the electronics board. Can anyone identify this battery pack?

Dear Mr Lucky,

I also bought a 746 from Martyn Lynch - around Xmas last year. No problems at all so far I'm pleased to say, although I was a little nervous at first switch-on as I know several people have had trouble with uneven lighting of the lcd display.

However, unless you're being hyper-critical, mine is ok - so hopefully Icom have sorted that one out. I chose Martyn Lynch however as I know first hand of people receiving excellent after sales support of the type you mention.

For those who drone on about importing from the US directly, how they would have got on in your case one can only wonder.

I hope your 746 continues to run ok, but I'm sure you will be in good hands if it doesn't.

Regards

Dave

Near mint 160-10 Meter transceiver with digital display, CW filter,
operator and service manuals. Very low hours...it still has the original
final tubes. No problems, a few documented reversable mods added from
Kenwood and HR. Two BNC connectors added on back to allow external
reciever. Asking $350. Local pickup in the Detroit MI area preferred. I
am the second owner (non smoker) and have had it since 1983.

135. Re: FT-8100 Problem

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-02 00:00:00 UTC
From: Alan <fromjustus@mediaone.net>
Message-ID: <37052B8A.FA5A1F93@mediaone.net>
Source record: 112013

John,

I know exactly what your problem is (or should be). I have a Yaesu FT-8000 which is the predecessor to the '8100, and I had the exactly the same thing happen to me. Both radio's are built pretty much the same way, so the fix should be the same too.

What it is, is that there is a right angled connector that the combination volume/squelch control plug into. The control board that is just behind the LCD display unit in the control head has the connector on it. The connector has 6 terminals, and one or more have come loose from the printed circuit board (PCB) and have to be resoldered. On mine, 3 were loose, just touching and the other 3 were ready to detach.

It is not a super simple job to repair, but depending on your expertise on taking ownership and repairing radio's, and your knowledge of working with mighty tiny things that have to be soldered and unsoldered, will tell you whether you should attempt this. If you know how to "micro-solder" and have the right tools, you can do it. If you have little experience at this, don't try it. Send it in for repair.

What you have to do, as I best remember, is to remove all the knobs on the control panel front, remove the "spanner" nut rings holding the volume/squelch control shafts to the panel front, and any other thing that is attached with a spanner nut. When the front control panel is removed from the radio, you have to carefully, always carefully, remove the control PCB from it's attachment to the front control panel itself. Be careful that you don't lose any of the small
pushbuttons along the bottom of the LCD, or the ones on the right side. Keep track of what you take off where, so you can reassemble it later.

When the control PCB is free, you will see the volume/squelch control plugged into the right angled connector. Carefully flex the shaft of the volume/squelch control and you should see the right angled connector terminals easily come
away from the PCB. That's what's wrong with the radio. Resolder all 6 terminals, and that should fix it all up. Check the other connector on the other
end of the PCB to see if any of those terminals have come loose. If so, resolder them too.

The pushing in on the volume control and twisting both inner and outer rings is

what causes the connector to come loose. The volume/squelch control fits so tight into the connector, the connector takes the brunt of the flexing, and its

terminals are what give way first, causing an intermittent that when you push volume control "sideways" it will sometimes make contact and work.

That's what it takes to fix your radio. It took me less than an hour, not knowing
what was wrong, or how to disassemble it from scratch. It's all up to your expertise on getting into things and not letting the "smallness" of parts scare

you. If you have a jeweler's "OptiVisor" (a headband with dual magnifier lenses
in it), use it or get one. It makes a hell of a difference when you are working,
and I find it much better than trying to work under a magnifying glass. A microscope also works well when you have the PCB removed from the front panel too.

Good luck to you,

Alan, WA6AQC

Eric

Just think about this..

your two "brand new" radios had core faults that were easy to detect.
Escaping defects like this would suggest that little or no testing was
carried out by the manufacturer or vendor. Possibly a simple go / no-go
ATE, maybe even batch testing. This of course is reflected in the
purchase price.

I wonder if your latest "brand new" unit has other inherent problems, a
few db here and there in the filter shape or the odd ripple in VCO
tracking here and there. These faults would be much harder to spot and
may even get worse as the days progress...

Not to worry you of course... but then you >>may<< have been third time
lucky.

:-)

ICOM IC-271H 2meter all mode transceiver.
The IC-271H operates FM, SSB and CW with 100 watts output and is considered as the standard of comparison in all mode VHF transceivers, and is great for working satalites. It includes 32 frequency/mode/offset/tone memories, built-in PL tones, scanning, adjustable tunning speeds, RIT, all-mode squelch and tone control. Output power is adjustable from 10 to 100 watts output. 12 vdc operation. Frequency coverage is 143.8-148.2 Mhz. Hand mike, power cord and manual are included. Mint condition physically and operational. Picture available on request. Asking $700...offers are always considered too. WA6NJR Marc

>Just be sure the Elements are correct for the frequency range that you are interested in.
>
>Bill W0IYH
>
>
and before you start, check that FSD appears with same power level
with SWR meter connected one way and the opposite
Have built some VSWR and power meters for 35 years, and have bought
some commercial power meters, OSKERBLOCK and Bird Model 43, none of
them are very accurate, including Bird model 43, but it is usually of
very little importance whether the power is 90 or 100W. Read the
instruction book for Bird Model 43 thoroghly to get a better
understanding of which levels the meter shows. Believe Marconi
Instruments 2955 is quite accurate for VHF/UHF, but it costs at least
ten times as much as Bird model 43

I have the Circ polorized KLM VHF (16' boom- 13.5 dbi) and UHF (15' boom- 14.5 DBi) cross AO-10-13 YAGIS, with polorization switchers. Asking 125.00 Each (For UTAH SLC Pickup only)

Have a LANDWERE VHF Preamp with TX Relay 18 DB, low noise, remote tower mount New: 259.00 asking 125.00

Have a YEASU 5400 Rotor ALT/ELEV 300.00

Almost new TELETEC DXP-175 25 watt in 175 watt out VHF Amp, with Gas Fet preamp Mobile amp New 295.00 Asking 175.00

Same 6month old RF COncepts RFC 10 watt in 100 Watt out UHF Mobile amp with Gasfet preamp new 325.00 asking 175.00

All these items are located in Salt Lake City, Utah and I'd like to sell this stuff locally, or at least where you can drive and pick it all up...

Email me...

I know of only one local ham who has bought the 746. He was quite
happy until he set up for 2M SSB and found he could not hear anyone.
Another 2M SSB rig worked FB at the station. Back to Icom.

Read your email to "iver@devtex.net" and you will see where I got the
story about the unit needing repair after comming back from
customs,read your email and see where I got the story about you
putting the unit in the shop, read your email and see where I got the
story about you being retired, and read your email and see where I
got the story about you already spending money I sent you,(at the
point in time of 30days and still no radio.)Read your email and see
where I got the story about you living on a pension, and could only
pay me back 10$ at a time. You had me and my money then and
now, and you don't want me to complain, ,,,,,,,,You send me the money
and I will send you back the radio, and our dealings will be over.
Send me the money, that is the solution that will solve this.
Jordan, you are not Yaesu, or Kenwood, or even Sears, you are
only as good as you name .
You say sending the money is not a workable solution, as
I recall it was the first time.
I will send you the paper work from the
Ham store, just send me an address, I have stated, if you want the
informtion, I will get it to you.
You say you don't know what my intentions are ,,,,,,I have plainly
stated from the begining,I want my money back, I stated that after
waiting 30 days and not receiving the radio, and at the end of six
weeks I felt even stronger about it when recieving a radio that
didnot work..
You return my money , and I will return the radio, solution solved.
You read your email, then talk to me about trust and integrity
.........Chuck Lorentson

Hi Alan,

Thanks for the information. Your description sounds exactly like the
problem I am having.
Not sure if I will try the fix, find a friend with the right tools or just
send it back for repairs.

Thanks again for your response.

Hello Everyone,

I also know of one person bought a new IC-746 and used it for field day last year. I seemed like a wonderful rig until another local station asked why we were not answering some of the stations calling us on 2 meter FM simplex. We could not hear them but the other station could. We quickly switched back and forth between the 746 and a Kenwood mobile using the same antenna setup. To our surprise the Kenwood FM mobile could hear the station quite nicely while the 746 could not. Using the manual we tried all sorts of adjustments on the 746 without any luck. The owner then sent the unit back to ICOM indicating the problem. They sent it back saying nothing was wrong with it. He sent it back to ICOM again and they returned it once again saying nothing was wrong. Finally, our local amateur radio dealer had one of the local ICOM representatives come to his shop where he showed them that the radio's sensitivity was no where near as good as another brand in the shop. At that point the owner was able to get his money back and bought a Yaesu 847.

The owner is just lucky we have a good dealer in Overland Park, Kansas. By the way, the dealership is www.associatedradio.com and has an 800 number and sells for about as low as AES and Texastowers. I am not associated with them other than I am a customer.

I have a *new* Bird 43 that I bought about a month ago. It has the 250 W and 1000 W elements for 2 to 30 MHz. I have
compared it with recently calibrated reference equipment and it has been found to be accurate as closely as I could read
the meter. The guaranteed accuracy is 2.0 percent of full scale, which is about 0.1 dB. At below full scale the scale
spreads out (easier to read), and my measurements were accurate as closely as I could read the meter over a wide range of
meter readings. The accuracy was the same in both directions.

As others have said, borrow a meter and check yours against it.

However there was an article in one of the magazines some years ago
on using a dummy load in water and measuring the temperature rise.

I would suggest that you take a dummy load and wrap insulation around
it. Then put DC into the load and measure the temperature rise and the
time it takes. Compare that to the temperature rise and the time with
RF into the load.

I leave it as a learning exercise for you to do the math.
(when you figure it out let me know too)

FWIW, my 746 has an FM sensitivity of .18 uV for 12 dB SINAD as measured
on an HP service monitor. This is certainly as good (in many cases
better) than anything else on the market at this time.

Hello Seth,

First, I would like to say that I have nothing against the 746 or ICOM. It also should be noted that the one radio I described does not make a sample as far as how good all the 746s perform. I myself compared the 847 and 746 on several occasions at associated radio. I felt that, at least on HF, that the 746 was a much better receiver. I liked the bigger controls and display also.

I do not know what was wrong with Kurt's 746 on two meters and six meters. When he sent it back to ICOM they checked it out on their service monitor and said everything was ok. However, under real world conditions this was not the case. I do not know what the problem was but we could not hear several station using the 746 during field day and on other occasions. We made sure we had the pre-amp engaged. Perhaps some other frequencies were getting into the receiver and de-sensitizing the front-end.

This could be an isolated case and your 746 may be fine. Perhaps you can get together with some of your friends on two meter FM simplex and check yours out against another non-746 FM radio you have handy in your shack. Talk with some stations far from your station. The idea is not to compare S meter readings but to see if all stations can be heard with the 746 in comparison with the other FM non-746 rig you have handy.

Anyway 73 and Happy Holidays,

Dave KG0US

I don't know what Tim smokes before he reads the "FORUM" but there have been a total of two bad radios and both units were sent in for repair. Most of any problems reported have been from operator error in getting to know a new radio. The majority of reports on the list is very positive.

The list is the FT100 list on onelist.

Yes, but one can always go to their web site if one wants to buy or peddle something. E-Bay is so tacky, commercial, and so often disreputable (sufficiently so that the commercial banks refused to back the original IPO), that I hate to do anything to support it.

Curious... I would have to guess that the unit you used was somehow defective. I have checked the 746 against two other radios on 2 meters, and its sensitivity is equivalent or better. I live in a relatively dense area, RF wise, to the point that handhelds don't work very well on an rooftop VHF/UHF antenna. On the same antenna, the 746 hears no intermod at all, and seems to maintain full sensitivity when compared with other radios when receiving weak packet signals.

My guess would be that your unit may have some kind of defect in the front end that made it sensitive to out-of-band RF, perhaps some defective filtering. This might not show up on the service bench unless you were specifically looking for it, which Icom probably was not. I do believe that yours is an isolated case.

I spent a good deal of time comparing the two units before I made my purchase decision, and I couldn't resolve any significant difference in HF receive performance off-the-air (except that the 756 was noticeably less sensitive at 144 MHz). The 756 does have a much better spectrum scope implementation though, no comparison there. If that is important to you, choose the 756. If you would rather have 2 meter all-mode in the radio, choose the 746. Otherwise I dare say they are very close.

I have a FT-50 ... It had lots of scratches on the display bezel. I was
real easy to fix.

All I did was to spend less than 5 dollars and buy a new display bezel
and the double stick to attach it. The fix took less than 5 minutes to
do !!!

Just call Yaesu parts and order the correct bezel and adhesive strip for
your Yaesu radio. Kenwood and Icom have spare bezels to sell also.

Good Luck all de Pat KK6PD

You have an older one. The newer ones are not type accepted and no longer have the type acceptance label. If yours can be front panel programmed, it is illegal in the U.S. regardless of what the label says.

Motorola JT 1000's are keypad programmable does that make them illegal? Also Kenwood TK 350 are programmable off the keypad. Neither of these are illegal.

I just bought a new Taurus Wagon , and am about to get a new rig--the Kenwood TM-V7A. I was wondering if anyone had any mounting suggestions, also are there any 1998-1999 Ford Taurus owners out there that have had trouble operating a mobile rig from their vehicle? (Problems with ABS, Airbags, ignition, burglar alarm , etc.) Any help would be appreciated.

I've got an older Ten-Tec rig, power supplies, etc and they all have been excellent/reliable units. Suspect that their tuners would be the same. I have an MFJ tuner (the 941). It's an OK unit but doesn't handle it's rated power. I've burned out the inductance rotary switch twice. My opinion is that if you buy a MFJ tuner, you should derate the power handling ability.

> an easy way for those who DON'T like
> such postings, to be able to ignore them..

The convention of playing nicely with others and obeying rules that were created to make the newsgroups possible and to keep them usable is much more important to most of us than setting up special conventions for the rulebreakers to break the rules with impunity.

ebay's continued insistence that its users drop these poopies in the newsgroups has generated literally BILLIONS of copies of advertisements, carried around the world to displace topical messages that truly belong in these newsgroups and to cut down on the discussion the Usenet groups were created for and are maintained for. If you want to see what's on ebay, GO TO EBAY.

Personally, I don't think 95% of the FA or EBAY postings on the NG cause any problem at all, if they mention equipment that would normally be sold/traded/bartered on the newsgroup anyway.
I do agree that the "updates" of ... three hours left on this one ... get a little ridiculuous, but we're only talking about one or two people who do that. As many people have mentioned, you can filter out the AUCTION or FA subject lines if it bothers you that much.

The little "typewriter pictures" and cutesy quotes and phrases at the end of dozens of NG posts consume much more space and are far more irritating than any one paragraph auction notice. Just my $0.02.

You gotta take the radio apart and solder it in.
It will fit the Kenwood TS-430, TS-440, and R-5000 radios.

190. FS: Spring Cleaning ,part 2 Tubes.

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-02 00:00:00 UTC
From: canfield@scci.NET
Message-ID: <199904021235.HAA06028@gdi4.gdi.net>
Source record: 112109

Hello All:

Here is part 2 of Spring cleaning:

Have the following NOS tubes. Still in orginal boxes, in very good
condition:
Tube # Catalog my price
prices
5751 5 9.50 4.75
5651 1 2.60 1.30
5636 4 6.00 3.00 (has wire leads)
6197 6 3.00 1.50
5726 2 1.75 .75
5814 7 3.00 1.50
6BQ5 2 9.25 4.50
12AT7 4 6.00 3.00
6AQ5 1 3.75 2.25
5840 1 9.00 4.50
5727 1 2.40 1.20
5687 1 3.15 1.50
5670 1 5.00 2.50
5654 1 2.25 1.15
6X4W 1 3.50 1.75
5725 1 2.50 1.25
6C25 1 2.00 1.00
Total for all tubes: $95.00

Catalog price is the average of 3 different companies.
Would preferr to sell in large groups if possible. Maybe able to work
a deal for a large group sale.

Have the following items:

Sonar Model FR-102 Monitor Reciever 150 to 175Mhz
This pre-dated scanners like the bearcat III. Works. In excellent
condition.
Needs some alignment/tuning.....$25.00 obo

23 assorted tube Sockets. 5 are white ceramic. very good condition
$15.00

One Shot Z-8318 5963 by Engineered Electronics $5.00

2 Vacum Gauge Tubes DV-3M $5.00 each. obo

KDK 2meter Transciever Model 2016A
144.000 to 148.995 steps @5KHz,

output 15 watts. Has tone. Is programable. Can store over 100 frequencies.
Has manual and mic. In very good condition.
It one quirk... receives on all frequencies, and transmitts on all except
146.000. For some reason.
Have not taken the time to fix it. Was given another radio. But a very good
and solid radio.
$25.00

Thanks for reading and the bandwidth.
Bill KF4PGU

sometimes you make out great. I purshased a Yaesu FT-890 when they came out at the Akihabara in Japan (mail order). The radio CAME with the 500 HZ CW filter standard as in the international version but the microphone was missing (mic came with the USA version). Still I was far better off as the Crystal filter cost $160 and the mic was $40.
Also the price of the radio was $300 cheaper than HRO was. I figure I paid $400 less since the filter was there already and I would have purchased it with the radio .

Reg,

As a rule of thumb, here in Southwest Florida, the "driving impedance" depends largely on the time of year, and which road you attempt to negotiate. From December to April (peak current), "peak rubbernecking folks" (Peak RF Volks) exceed capacitor dielectric limits, and cause severe arcing of the drivers. Once the excess RF are shunted to ground (Home to OH, PA, NY, ON on I75), and the capacitors restored (new bridges built, roads resurfaced), the driving impedance returns to specs, until the entire circuit overheats in July, causing local oscillations, and forcing the addition of cooling fans. As the sunspot cycle wanes, and operators use more power to compensate, the cycle begins anew, only this time, larger capacitors are wired into the circuit, to handle the increased load. ...

73, Mike

I've used one since they came out for packet and for weak-signal work
driving a Mirage amp. The only thing I wish it had was VOX, and an
outboard unit takes care of that. Without doing any quantitative
measurements, I am very pleased with the sensitivity, being able to
hear people I can't work with 150Watts and 11 elements. Selectivity
and overload characteristics seem to be adequate, and I get lots of
opportunity to evaluate them in the Northeast!

All in all, I have been extremely pleased with my IC-275.

<crrandal@seidata.com> wrote:

How to calibrate a homebrew power meter?

How accurate do you want to be? For starters, bypass any coupling capacitors at the input to your power meter and apply a DC voltage. Measure the DC voltage with as good a voltmeter as you have and that should be pretty close for relatively low frequencies, relatively meaning compared to frequencies where the parasitic reactances in your power meter begin to be important. Or, borrow a Bird wattmeter and compare readings to it. I did that with a couple of SWR meters I had and was pleasantly suprised to discover that they were pretty close. The principle source of low frequency inaccuracy in RF measurements is the voltage drop across the rectifier diode. You can calibrate it out if you know what kind of diode you have, Germanium or Silicon. The ARRL Handbook has some information on building RF measurement gear.

Good luck, have fun!

Motorola JT-1000's are not kepad programmable unless the "dealer key" is plugged into the side. The kenwood TK & Icom U-16 needed dealer modification (many were sold like this) to be keypad programmable. When these radios were type accepted it was in the original form. GP-68 & AP-50's were accepted for amateur use only & would originally only xmit on ham bands "out of the box" w/out a dealer mod.

One feature that Yaesu forgot to put into the 990 is a way to monitor your
transmitted audio.
The 990 has features to let you shape your audio, but no way to listen to it,
unless you listen in another receiver.
Other than that, it is a fine radio. Choosing between the 990 and the 850 is
not easy.

Martys statement is true. To elaborate a little, amateurs are one of the few groups (in the US) who are allowed to build and operate their own station. After all the stated purpose of amateur radio, per FCC, is to foster technical expertise. Hams are allowed to build / modify two per year of most devices without gaining FCC type acceptance.

In general, equipment for other services (11m CB, aircraft radios, marine radios, etc) require FCC type acceptance regardless of who made or modified them. So it is perfectly legal for you to take a device built for some other service and modify it for use on the ham bands. But to do the opposite is not.

I agree with Marty that no one would likely notice if you modified a radio to operate on 11m CB.

Unlike Marty, however, I don't have any problem with the FCC.

Source record: 111880

The pre-amp off blocking dynamic range dB rating for the radios is:

756 746
3.5 mHz 137 dB 123 dB
14 mHz 132 dB 122 dB

What's the significance of this difference (IOW, what is the test telling me)? Does a 10% diff. really mean anything?
It appears to be about the only quantitative difference between the radios.

What I'm after is the "best" contesting rig I can get for under $2,000. I'm mostly interested in SSB performance. (CW is just a hobby).

Minor point, but the quote sounds fake. I believe that muskets were the
cutting edge of military technology in Jefferson's time. I think paper
cartridges didn't come until about 1850.

I bought a mobile rig a week ago from RLS Electronics in Arkansas. It did not suit my needs so I took it back yesterday. The rig had not even been taken out of the packaging. The person at the store told me that I would have to pay a 15% return fee. He also told me that he had not received a return before. I am sorry, that is redicilous!!! I had not even taken the rig out of the packaging and I get charged? I had been a loyal customer in the past and spent a few dollars in the store. Come to talking to several HAMS in the club here, he has been a pathalogical lier and dishonest in the past. The sad part is He is a HAM. I wanted to spread the message so noone else has to take a loss as I did. 73s KD7CTR

214. FT2400 Lithium Battery Question

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-03 00:00:00 UTC
From: crs1026@inforamp.net
Message-ID: <37069c9e.34487229@news.istar.ca>
Source record: 111883

My FT2400 loses its memory every time I leave it turned off for a couple of hours....which I'm guessing means I need to replace the lithium battery.

Before I run off to the local radio shop and pay big bucks....can anyone tell me what kind of battery it is - ie is it a specialty Yaesu item or just something I can get at a good battery store? It is easy to change out or am I smarter to let the tech do it?

Many thanks
Paul

Clue in the other users as to what??? I had offered 4 times for him to return the unit and he has refused for over a year... I've had MANY supportive e-mails regarding this matter , and NONE that were sent to exert pressure.... What pressure would YOU like to exert... this matter is over a year old and my offers were all disregarded... I have nothing more to say in this matter. 73 de Jordan...

I believe if you do some checking, you will find that most radio stores have the same policy. If you want to return a piece of gear, it will cost you a restocking charge, which in my opinion is very gracious on behalf of the dealer.

In the automotive parts business, most stores will not accept a return on electrical items period, due to the damage that could be hidden inside the component......a piece of ham gear could have the same damage, for the next guy to buy.

These pissin contests are never going to be settled in any forum.
If it was an Ebay deal, let Ebay settle it. If it was here how are we going
to fix the problem, and where is the opposing view?

Source record: 111900

Neal,

The numbers you posted are in decibels which are logarithmic so doing a straight percent difference does not do them justice.
Let me give you an example:

Let say you have a 5 Watt handi-talkie and I have a 50 Watt mobile. The 5 Watt output is roughly 37 dBm while the 50 watt output is roughly 47 dBm.
Now, would you say I am putting out 27% (47 dBm/ 37 dBm) more power than you or would you say I am putting out 1000% more power?

Anyway, I think the 746 and 756 are both good rigs but some question why the 756 costs more. I suggest that the PIN diodes and other circuitry that makes for higher blocking dynamic range costs more money.

Enjoy your new 746, it is a good rig.

I am sorry everyone for I did not put emphasis on the fact that the automobile example was not to be taken literally. And for those of you that did not know, Corvettes are quite a bit more expensive than Escorts but both can be used to get the babies milk at the grocery store.

I also did not mean to imply that the 746 was an Escort even though the 746 may cost more than some of the used Escorts available today.

As for a test to determine QSOs per dB of Blocking Dynamic Range, look no further than www.contesting.com. There is a database on that page describing what most of the serious contesters use. You will find that almost all use the higher end rigs with the higher Blocking Dynamic Range numbers.

The 746 and 756 are both good rigs,
pick your poison,

73

PIN diodes to do necessarily increase performance, in fact often the
inverse is true. That is why both radios employ several relays.

Seth,

I am not 100% sure why the 756 cost $200 more than the 746 with one band less. Perhaps Gary Fiber can enlighten us. He answered one of the other posts on this list. I am assuming that he is the same Gary Fiber that works for ICOMs Tech support.

I too have a Heil Pro set and like it very much. It replaces the Micro I had initially. The Micro is so light and the "springiness" so slight that it was constantly moving on my head. All I had to do was rotate my head, and band, I had to readjust it. It was just too light and would not stay in position. Even the slightest pull on the cord disturbed it's position. The Pro is just excellent!

I think ICOM screwed up and made the 746 too good. For more money for the 756 you get less bands, a better band scope, morse announcement of freq/mode/etc for the visually impaired, and an analog meter. For me this was a net "who cares" so I bought the 746.

Near mint 160-10 Meter transceiver with digital display, CW filter,
operator and service manuals. Very low hours...it still has the original
final tubes. No problems, a few documented reversable mods added from
Kenwood and QST hints and kinks. Two BNC connectors added on back to
allow
external reciever. Asking $350. Local pickup in the Detroit MI area
preferred. I am the second owner (non smoker) and have had it since
early
eighties.

>unit before shipping it...

My experience of that particular dealer is that he doesn't have the technical capability (let alone the commercial integrity) to test anything so complex. He mis-diagnosed an FT-5200 which was drifting 3.5 kHz to 10kHz low on 70cm transmit as requiring nothing more than the deviation tweaked up. Up to +/-8 kHz to be precise.

It is, however, a pleasant surprise to see that he does now take positive steps to replace faulty equipment. He did absolutely nothing to remedy various problems with my FT-5200 (including the one described above) which developed within 3 months of purchase from new. I ended up fixing the "fixable" ones myself.

I have a 756 and it does not have 144 Mhz. Is this something they put
on the newer models???

Since I already have one, I havn't been keeping up with the ads on the
newer model 756.

BTW, I am very pleased with my unit.

Hi Randy -- I just calibrated my Swan WM-2000 -- using a Bird Watt Meter
as the Standard.

Hi,
I have a very good condition Drake MN-4C antenna tuner with built in watt meter. This is designed to match the 4-line gear including the TR4C, the R4C/T4XC twins, etc. It looks much like the MN-7 tuner but is in the 4-line color scheme. Rare item. Does not include the balun option.

Tunes random wires and coax wires. 160-10M, 300W capability. This is a nice tuner!

Hi,
I have an excellent condition Ten Tec Century 21 "digital" transceiver.
Covers 80/40/20/15/10 meters....CW ONLY rig! Digital Freq readout.
40W+ output on all bands. Silky smooth QSK. Built in PS or run it from
13.8VDC. Y2K compliant! A great little radio. Receives SSB too. With 0.5K /
1.0K/ 2.5K bandwidth selectivity. A nice piece for a collector or to use on
the air every day.

AMPR.ORG addresses are, in general, unreliable. I administer a number of Internet lists, and zapping dead or useless AMPR.ORG addresses is a daily chore. If the lists I run weren't Ham-related in the first place, I would not bother allowing them access. Maybe it's just pure stubborn-ness, but I let them in, only to end up having to zap them, normally within the first week or so.

On the other hand, I've had some of them stay valid for several months. My theory is that practice makes perfect. If I keep letting them in, sooner or later things will improve.

Try to be patient.

Mr. Lorentson, obviously you have me confused with someone else, I have never stated that I could pay you back $10.00 at a time.Nor have I told you that I was retired. I have long sice deleted any e-mail from you , as I had not heard anything from you for over 5 months on 2 separate occasions. I have NOT heard from anyone else , nor have you forwarded the names or e-mail addresses of those who YOU claim had warned you about myself. I don't expect to either. As I stated earlier, you may do as you see fit with the rig, as my offer to have you return it has obviously fallen on deaf ears. I have never denied the possibility that the rig may have been damaged in shipping, and you have not even accepted this as a POSSIBLE cause of any problems. You are of the impression that I knowingly sold something to you that was not in good working order. THIS I RESENT VERY STRONGLY. You may wish to continue to air this matter publicly if you wish, but I will no longer respond to this. You were offered to return it and you have refused EACH AND EVERY

TIME, and you have also not even clearly stated what the problem is or was. As per my previous post my offer of having you return the rig for inspection has been rescinded.

I am truly sorry to have wasted the BW on this matter and apologize to those who administer this NG. 73 and Have a Nice Easter Weekend... de Jordan...

Read your email to "iver@devtex.net" and you will see where I got the
story about the unit needing repair after comming back from
customs,read your email and see where I got the story about you
putting the unit in the shop, read your email and see where I got the
story about you being retired, and read your email and see where I
got the story about you already spending money I sent you,(at the
point in time of 30days and still no radio.)Read your email and see
where I got the story about you living on a pension, and could only
pay me back 10$ at a time. You had me and my money then and
now, and you don't want me to complain, ,,,,,,,,You send me the money
and I will send you back the radio, and our dealings will be over.
Send me the money, that is the solution that will solve this.
Jordan, you are not Yaesu, or Kenwood, or even Sears, you are
only as good as you name .
You say sending the money is not a workable solution, as
I recall it was the first time.
I will send you the paper work from the
Ham store, just send me an address, I have stated, if you want the
informtion, I will get it to you.
You say you don't know what my intentions are ,,,,,,I have plainly
stated from the begining,I want my money back, I stated that after
waiting 30 days and not receiving the radio, and at the end of six
weeks I felt even stronger about it when recieving a radio that
didnot work..
You return my money , and I will return the radio, solution solved.
You read your email, then talk to me about trust and integrity
.........Chuck Lorentson

Read your email to "iver@devtex.net" and you will see where I got the story about the unit needing repair after comming back from customs,read your email and see where I got the story about you putting the unit in the shop, read your email and see where I got the story about you being retired, and read your email and see where I got the story about you already spending money I sent you,(at the point in time of 30days and still no radio.)Read your email and see where I got the story about you living on a pension, and could only pay me back 10$ at a time. You had me and my money then and now, and you don't want me to complain, ,,,,,,,,You send me the money and I will send you back the radio, and our dealings will be over.
Send me the money, that is the solution that will solve this.
Jordan, you are not Yaesu, or Kenwood, or even Sears, you are only as good as you name .
You say sending the money is not a workable solution, as I recall it was the first time.
I will send you the paper work from the Ham store, just send me an address, I have stated, if you want the informtion, I will get it to you.
You say you don't know what my intentions are ,,,,,,I have plainly stated from the begining,I want my money back, I stated that after waiting 30 days and not receiving the radio, and at the end of six weeks I felt even stronger about it when recieving a radio that didnot work..
You return my money , and I will return the radio, solution solved.
You read your email, then talk to me about trust and integrity

Source record: 111960

You will see that the 756 is a better HF receiver than the 746 if you compare the ARRL tests results. For casual listening you will probably not be able to tell the difference. It is like comparing a Ford Escort to a Corvette when all it is being used for is to go get a gallon of milk at the local grocery store. They both get the job done somewhat equally. However, the performance is quite different when driving on the slalom track. The place where the 756 has the potential to shine is in contesting where the higher blocking dynamic range and other parameters would out perform the 746. Unfortunately, ICOM screwed up in my opinion by not allowing enough slots available for crystal filters in the 756. This radio would have probably been a great contest radio, a poor mans 775 if you will, if their was available filter slots to take advantage of the receiver's performance. I do not understand why the manufacturers repeatedly make these fundamental error. The Kenwood 870 is another example. Give us the crystal slots and let us decide if we want to fill them.

I was hoping to find out if the Uniden Lincold radio is still sold.
If not, what is another good radio that can cover the 10 & 11 meter bands??
Perhaps an 11 meter radio that can be modified to cover 10 meters?
Ray

282. FS Complete Ten-Tec Omni D station $550 shipped

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-03 00:00:00 UTC
From: N9IVO <steam@megsinet.net>
Message-ID: <SCtN2.108$%K3.1010@news.megsinet.net>
Source record: 111967

I have a complete Omni D, series B station that also includes
both the 12 and 30 meter warc kits(uninstalled) and the instructions
for the kits. I bought the pieces to put this full station
together but have found that I prefer a modern rig so will sell
the Omni station. I think the only piece I don't have is the
tuner and it also does not have the noise blanker. (I hear this
was a rather ineffective noise blanker anyway!)

Omni-D series-B factory upgrade serial # 106
SSB and CW filters were installed with the factory B upgrade.
I have both (30m & 12m) warc kits with instructions (uninstalled)
I got the kits with the rig and a ham on this reflector was kind enough
to supply me with the instructions that came with the kits originally.
I don't have the nerve to attack the installation myself. I'm sure
Ten-Tec would do the installation.

Model 232m matching power supply with the over current
protection kit. (also uninstalled)

Model 243 matching external VFO for working split

Model 645 matching keyer/paddle

Model 705 desk microphone

All manuals are included.
This is a complete station and I won't break it up, so
please don't ask me to.
All equipment is in top-notch shape and works perfectly.
My price is $550 shipped.
It can be seen on my web page.
Just click on the link below and then go to the ham radio
page. I'll also e-mail larger pics on request or if you're from
the Chicago area, you can come check out and operate it
if you like.
Thanks... Mike, N9IVO

Dave,

You should probably find 2 car models closer in price. I don't know what they go for, but you can probably buy 4 or 5 Escorts for the price of a Corvette. If the 756 is a Corvette, the 746 is definitely *not* an Escort. And while the test numbers may favor the 756, I wonder what that truly translates to in the real world. Maybe a test is in order to determine Contest QSOs per dB of Blocking Dynamic Range. :-)

Hi guys,
I have the following computer equipment for sale or will swap for ham equipment.
I am looking for either vhf or uhf ht's or mobile units or low band gear.

IBM ThinkPad 360/cs 486 75 MHz laptop it has a active screen 1.2gig hard drive, (2) pcmcia slots, 24 meg of memory, 3.5 inch floppy it has windows95 loaded, $275.00

Epson action note 650C 486DX2/50, 540meg hard disk, 20 meg memory, dual scan screen, (2) pcmcia slot, 3.5 inch floppy, has windows95 loaded.
$200.00

I also have a clone 486DX2/66 with 16 meg of ram 340meg of hard drive sound blaster, and mouse and keyboard in a mid tower case, 14" Magnavox svga monitor, This monitor is less than 6 months old $250.00

Also I have a number of hard disks from 120 meg to 1.gig if interested email me for pricing, I have many
I also have a few 2.5 inch laptop hard drives from 240 meg to 1.4 gig same as above email me.
I have a number of SCSI drive 470 megs to 800 megs,

I have a Adaptec scsi controller the 16 bit ISA version model 1540 with cdrom containing win95 and dos drivers. ($65.00)
I also have a number of 4meg 30 pin simms asking 5 dollars a stick.
For you Linux guys I have a Sun Sparc station 2 with 96 meg of memory 1gig of hard disk, and a 17 inch Hi res monitor, mouse, keyboard $350.00, I also have a Sun Sparc IPX with 64 meg, 1.2 gig of drive, 15 inch monitor, keyboard mouse. ($250.00)

NOTE: all of the above equipment works and has been check out, on the Sun equipment all the monitors are Sun (Sony), everything is from sun and works great, I can load Linux 5.2 on them or Solaris 7.0 both new versions.

Please reply to craigs24@worldnet.att.net

I am a ham my call is WA2TWF I am house cleaning, so email me your offers.

Source record: 112046

Hi,

I have an old TS520V that I've accidentally caused damage to its internal parts months ago.
The damaged parts of the Japanes-made transceiver are two sheets of band selector switch, connecting S5-1 through S5-5 on the circuit diagram of TS520 user manual.

Does any one know where I can purchase the parts or replacements for the damaged selector switch, or maybe used ones/replacements that will work?

Please E-Mail me at hl1hg@shinbiro.com if you can help.
Thanks.

Woo-young Kim - HL1HG

292. Request info on radio frequency scanner

Just a few basic question, i didn't feel like reading tons of info in FAQ's or stuff like that.. i just hope that some of you can quickly answer the following questions.

Can a radio frequency scanner intercept digital data transmissions? If yes, what kind of data it is likely to intercept, i mean who interchanges data by radio, apart from cellphones, pagers etc? If there are some sorts of digital data transmissions on what frequencies i'm most likely to pick something?

I know that rfs is not a transmitter, but still, can it be sorta triangulated or located in any way?

That's it, just a few straight to the point questions. Feel free to reply in newsgroup or by email.

Cheers.

Center is POSITIVE.

Just FYI...my cigarette lighter adapter (the type that slides on like a
battery) puts out 8.1 VDC...NOT 9.6. I believe the FT-50 operates at very
near the maximum power out at the 8.1VDC level.

The TRUTH of the mater is that the applicable FCC rule is vague and
ambiguous.

In a reply to, "Is the Icom U-16 'legal' to use on GMRS?" - we need
to look at FCC Rule 95.655...which is not as specific as (I think)
it should be:

95.655 Frequency capability.

(a) No transmitter will be type accepted for use in the
CB service if it is equipped with a frequency capability
not listed in 95.625, and no transmitter will be type
accepted for use in the GMRS if it is equipped with a
frequency capability not listed in 95.621, unless such
transmitter is also type accepted for use in another
radio service for which the frequency is authorized and
for which type acceptance is also required. (Transmitters
with frequency capability for the Amateur Radio Services,
Military Affiliate Radio System and Civil Air Patrol will
not be type accepted.)

(b) All frequency determining circuitry (including
crystals) and programming controls in each CB transmitter
and in each GMRS transmitter must be internal to the
transmitter and must not be accessible from the exterior
of the transmitter operating panel or from the exterior
of the transmitter enclosure.

Let's break apart that (b) paragraph as it relates to
the U-16:

"(b) All frequency determining circuitry (including crystals)
and programming controls in each CB transmitter and in
each GMRS transmitter must be internal to the transmitter..."

Which it is in the U-16.

"...AND must not be accessible from the exterior of the
transmitter operating panel or from the exterior of the
transmitter enclosure."

First, the conjunction, "and" is used...non-type-acceptable
units must meet BOTH - not just one or the other condition.

"Not be accessible from the exterior of the operating
panel"??? What does that mean? Is the "operating panel"
the DTMF pad? If so, the this part of the sentence states, "must not
be accessible OUTSIDE the keyboard..." - which makes the
U-16 acceptable...SO FAR.

Because the U-16 is programmable by using the keypad.

The second part of that sentence: "[nor] from the
exterior of the transmitter enclosure." I guess that
relates to "computer programmability." What DOES it
refer to?

If I take that rule literally, the U-16 is OK. But
NO Motorola commercial HT that is computer-programmable
could EVER be accepted/used/sold for, say, GMRS use.

299. MFJ 624D phone patch instructions?

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-03 00:00:00 UTC
From: esh@csi.com
Message-ID: <37056c73.3959889@news.compuserve.com>
Source record: 112054

I bought an MFJ 624D phone patch at auction for use with my ICOM 706-II. Unfortunately, it came without a manual, and I haven't yet been successful in getting MFJ to acknowledge my request for one. Does anyone have a manual they could copy and send or e-mail me? It seems to be functional, but I don't know how to set it up for ICOM radios.
Thanks, Ed.

306. RARE -- Brown Brothers Paddle/Key, Model CTL-B at eBay

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-03 00:00:00 UTC
From: jeff@detray.com
Message-ID: <7e41ik$c7p$5@fir.prod.itd.earthlink.net>
Source record: 112061

Brown Brothers Paddle/Key, Model CTL-B

See eBay Auction:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=84048700

Manufactured by the Brown Brothers Machinery Company, St. Louis, Mo.

In recent years, the Brown Brothers paddles and keys have become collector's items; they are increasingly rare. These beautifully-made, precision keys are still great for everyday use as well.

The Model CTL-B consists of a twin-lever paddle and a heavy-duty straight key on a single 3ï¿½" ï¿½ 4ï¿½" metal base. Both keys are fully adjustable. The frame and base are finished in baked black wrinkle enamel. The mechanisms are chrome, and the straight key features ï¿½" silver contacts.

The mechanisms are in mint condition. There is some chipping of the enamel finish on the base, mainly along the edges. This is visible in the photographs. This fine example of a Brown Brothers paddle/key will make a great addition to your key collection.

Auction ends Sunday afternoon. Visit the auction to see photos and to bid.

Heathkit Test Equipment at eBay

Heathkit Model IM-18 VTVM

See eBay Auction:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=84151573

Model IM-18 Vacuum Tube Voltmeter with both regular and RF probes. This meter is in good working order. There is some paint flaking on the sides and bottom, but the meter is completely functional. The front panel is near perfect.

Heathkit Model IG-5280 RF Oscillator

See eBay Auction:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=84028973

Model IG-5280 RF Oscillator complete with original test leads and instruction manual. Superb condition and in good working order. Auction by original owner/builder.

Whether you need an RF oscillator or are looking for a nice piece for your Heathkit collection, this item is for you. Provides AM modulated or unmodulated RF signals in five overlapping bands from 310 kHz to 110 MHz. Includes a continuously variable attenuator and 1000 Hz oscillator for modulation.

Heathkit Model HD-1250 Solid-State Dip Meter

See eBay Auction:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=83999564

Model HD-1250 Dip Meter complete with all coils and instruction manual in original case. Superb condition and in good working order. Auction by original owner/builder.

Meter can be used to determine the approximate resonant or operating frequency of either energized of de-energized circuits in the frequency range between 1.6 and 250 MHz. Whether you need a dip meter or are looking for a nice piece for your Heathkit collection, this item is for you.

All three auctions end Sunday afternoon. Visit eBay to see photos of each item and to bid.

308. Astatic D104 Microphone -- eBay Auction

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-03 00:00:00 UTC
From: jeff@detray.com
Message-ID: <7e41p4$c7p$6@fir.prod.itd.earthlink.net>
Source record: 112063

Astatic D104 Microphone on T-UG8 Stand

See eBay Auction:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=84882349

Classic D104 microphone in great condition. Chrome is excellent. The T-UG8 stand has built-in amp powered by a 9-volt battery in the base. The base is clean but has a few small scratches and wear marks. There is a complete wiring schematic inside the bottom cover plate.

The cable contains one shielded conductor for audio and two unshielded conductors for push-to-talk (PTT) control. A toggle switch on the base determines whether PTT operates by grounding the red conductor or shorting together the red and black conductors, depending on the requirements of your radio.

Auction ends Sunday afternoon. Visit eBay now to see photos and to bid.

According to a December 1990 QST review, the IC-761 was modified into the IC-765 and no IC-761A was ever produced. The best way to compare is probably to read the reviews of both radios. You can download the articles from the www.arrl.org if you're an ARRL member.

Message-ID: <01be7d94$96ab67c0$4e9fded1@default>
Source record: 112069

I've been through all the dejanews articles and read the QST reviews; now I'd like to hear the views of those "unfettered by the thought process" -

Why buy an IC-756 at this point? Isn't the IC-746 as good. I'm obviously trying to convince myself to spring for a 746 and shell out $400 more for the older 756.

Also, does anybody know of any production refinements that should compel me to look at serial ##s at the time of purchase.

Hi all and thanks for reading this,

I have an Alinco ELH230g 2m SSB/ FM Linear that I picked up locally at a ham fest with the view of sticking it on the back of my FT290R Yaesu.

I was told that the final was blown when I bought it, simple I thought just replace the final. Problem is I cant tell what the final is, as the letters and numbers have been worn off and I have not got a schematic.

Can anyone help with identifying the offending part?

Please e-mail me direct as I don't visit the news groups often.

Thanks in advance

Pros: Nice little radio. Handy for crossband repeat use when you're out of your vehicle. Great wideband receive capability. Decent battery life, wonderful audio.

Cons: Limited Tx on UHF (just 10 Mhz).

Would like to find a way to open up transmit bandwidth, on both VHF and UHF, without resorting to surgery.

Look at www.alinco.com then hunt for the model. The dtmf ddey pad is 15.00. PAY VERY CAREFULL ATTENTION TAKING IT APART. You must put it back together. I didn't see the faceplate listed, but I wasn't looking for it.

Good Stuff! I find it works wonders on pots also.

Some people have mentioned a conern about gummy residue buildup.

Have you noticed any problems, or had units returned later because of
WD-40?

Best Regards,

I have for Sale a Motorola Micor VHF 4 channel radio. It does 110 watts and includes:
Control Head, Microphone, and Instruction Manual. The Manual has all the Alignment procedures, schematics, diagrams, and circuit descriptions. I am selling this unit because of a lack of interest by my Radio Club to pursue putting up a repeater.
I am asking $150 for the whole thing including shipping to the lower 48 states.

Model # T73RTN3190A Serial # OG670J

Radio Shack Hand Held Scanner - includes, supplied antenna, rechargable nicads (that hold a good charge), and a wall charger.

Unit is in excellent condition with the exception of a few tiny surface scratches in the display that you can only see if you hold the radio on an angle, it does not affect seeing the display at all.

Receives:
30-54
118-136.975
137-174
380-512
806-823.9875
849.0125-868.9875
894.0125-960

I will sell this for $125 + shipping to anywhere in the continental US.

This radio is guranteed to work 100% on arrival and be in the exact condition as stated.

> contacts with this material.

You might be surprised. Things like WD40 and TriFlow aren't conductors themselves, but they unquestiionably do aid in making good electrical contact. I had to convince myself of this -- I sprayed a deep puddle of TriFlow (which is basically WD40 with Teflon) on a piece of copper-clad board, then lightly brushed a single strand of #40 AWG (or something very close to it) through the puddle. An audible continuity tester showed the connection quality to be excellent -- the wire made much better, and more consistent, contact with the board surface underneath the pool of TriFlow than in a similar test where the wire and board were both left dry. I guessed the Teflon residue would interfere with conduction once the hydrocarbon carrier dried up, but that turned out not to be the case either.

That's not to say there isn't better stuff out there, but both experiment and experience suggest that WD40 is unjustly maligned. For pots, yes, you usually have to replace them in the end. But for dirty wafer switches and such, there doesn't seem to be any real advantage to the more expensive stuff, as long as you're sure the WD40 won't attack any nearby components.

The distinction between a cleaner and a lubricant is not an important one in this case. Something that reduces the friction between two surfaces will also tend to get rid of unwanted particulates between them.

Naw, I had the pleasure of paying $1840 for mine.

There has been a $200 off deal going since January (as is common during the slow sales months of the first quarter), but I believe that it expired March 31 and I guess it is back up to the $1750 range unless Icom has extended the special price.

I learned my lesson - buy any big ticket items in Jan-Feb...

It's called a restocking fee, all low margain businesses have them,
HRO and others included. Wrapped or unwrapped, it doesnt matter,
because you just screwed up the store's stock count, so they "fine"
you for it.

Just want to let you know about the TX mod fpr the new 706 MKIIG. Just kill the Diode D2030 and use it. Be careful, the radio has no TX-filter units for all bands. Please never use the modified radio only with very low power, because otherwise filters could burn out. The radio generates full power on a very wide range.

Interesting! My experience with HRO was a bit different. I received 2 DSP units for Xmas, one from HRO and one from a distant dealer. I decided to keep the non-local one (HRO is local). They were most agreeable to accept the "unopened" unit for return. I must add, however apropos (or not), that I was buying other stuff at the time. Finally, 10% is a standard restock charge; 15% is a bit excessive.

Richard, I bought one of thoes off the swap pages and the wire going
from the bnc connector to the circut board was not connected. I would
guess that is your problem and when you put a heaver antenna connector
on there it moves the wire enough to disconnect it from the radio.
Good Luck.

Sorry you are having difficulty in getting someone to work on your tube rigs and can understand fully. On the other hand, I have to take-up for the smaller and specialized repair shops. I work on both tube and solid state equipment and the cost factor (time involved and parts) limits work on older equipment.

I have had many dealings with Tom @ Denver Radio and Curtis @ HRO in VA. and have always had professional and courteous service. If I have a problem that I cannot handle with an older rig, I send it to an independent repair shop in Washington state. Scott was lead Tech with Icom before he started his own shop.

Look around, there is always someone out there that loves to work on the older equipment and they do, in most cases, a great job. Good luck in you search and happy DXing.

374. Re: Radio Store Ripoff

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-04 00:00:00 UTC
From: Bob Smith <user@msn.com>
Message-ID: <#I3D3Uqf#GA.59@upnetnews05>
Source record: 111849

Actually I think this is our fault. In my other interests, Astronomy, Shooting, and 4x4s only shooting has this same 're-stocking' fee business. What makes shooting and radio the same is that both enthusiasts will makes hours worth of phone calls and order merchandise from thousands of miles away to save something like $5.00 and a $2000 rig. Thus, the merchants have had to resort to things like re-stocking fees and so forth because the margins are gone gone gone.

I pick a merchant and stick with them. Fortunately, I am lucky enough to have a radio store local and have dealt 100% with them and don't haggle them down $5.00 here and there for 5 years. I would not even think of dropping a dime to a mail order dealer even if I knew I could save 5 or even 10% - because I know those guys are going to be there for me if there is trouble like a DOA unit. Man, imagine the trouble and hassle on a DOA unit from California to the east coast. I don't even want to know what the procedure would be.

So, in my experience - deal with one shop (local or mail order) - deal with them reasonably - avoid the reputation for a lowballer and cheapskate - and they will do favors for you. Logically, if you follow the above recipe the store should value your business and not put that at risk by doing anything to piss you off.

All reminds me of that half ass'd, stupid article in QST a few years back - what was it - dialing for dollars about a guy who dials around to all of the radio dealers looking for a HF rig and saves something like $40 on a $1500 rig - after using up a whole day and sucking up 800 charges that are now added to the price of the next rig I HAVE TO PAY for. Man - if I were a dealer I would have pulled my advertising from QST right then and there - what a bunch of idiots for running something so stupid. Our actions such as these have reduced these dealers to commodity traders - radios are not commodities, they are complex instruments - but their slim margins have forced them to be treated this way. So they are sold and given very little support post sale - how can there be without any margin? SO, the little guy goes out of business and the big guy comes in, a bit more stable, but more of the same - soon, there are only two left - then it's easier for the hams to bargain - there's just two merchants to call now and sooner or later they go out as well - then where are we left.

Sorry for the rant, but this has always been a pet peeve of mine :)

As for the original poster - if you feel slighted, and given the circumstance you outlined - done a lot of biz with them in the past and the unit came back un-opened - you should make sure you talk to the owner about it and let them know you are dissatisfied - if they still do not satisfy you - I agree, let them know that you'll go elsewhere.

Return the merchandise and take the hit or keep it and let them know that you are thankful that this lesson about how they treat their customers didn't come at a higher price.

I agree. Ask any dealer if some know-it all wanna be tech can do something with a soldering iron to the inside of a mobile or HT & then bring it back the next day looking brand new in the box with an un filled warranty card & some "it didn't suit my needs after all I just wanted to rent it free for a day" excuse. "hey Joe, go down to Ham-a-rama, pick up a Yaesu FT-50 & try doing those mods you saw on the internet. if the don't work just cash it back in for money". And more likley is the "cheap ham" (most of us) that would find the rig $20 cheaper somewhere else & there would be nothing to stop us from bringing it back & screwing the local dealer because they are nice enough to have a "free trial no restocking fee return policy".

If it could be done, they would not be allowed to sell them.
The only possible way would be to get a unit meant for use
in another country that didn't have USA laws regulating this.
Possibly European or Japan.

Yes Washington State has a law on the books against spamming. For
every spam I get I can report it to the Washington State Attorney
Generals office and can levy a $ 500.00 fine against the spammer.
Though I have not done so yet there are a few in Washington State who
have collected. I would have to look at the law again to see just how
it works, but thought I would place that I was a Washington resident
so spammers know before sending spam to me.

The copyright is to keep archivers from using my replies without my
permission. I have found a few instances where my replies were quotes
on CD-ROMs. So now I copyright my responses.

Yeah, right.

As a responsible consumer, did you ask for the store's policies before you made your purchase?

Calling reputable business owners who maintain normal, reasonable business policies "pathalogical liers" in public shows us all we need to know about you...and also borders on libel.

I discovered the same problem. I checked the BNC connector internally and it is fine. I've heard a variety of theories for this behavior, including that a higher gain antenna causes receiver section overload.

In any case, I've given up using the HT in the car with an external antenna.

here's the short form:
i've put my icom 706 in my pickup and have started to install the
anntennae ;-)
mounted on the bed rails near the tailgate are:
L/side, pro am 6m stick on a standard 3/8 thread mount
R/side, pro am 10m stick on a standard 3/8 thread mount

here is the snag;

over each fender well on the bed rails i want to put again
2 standard 3/8 thread mounts, 1 on each side.
what does the group recommend for antennae?
i am looking for a 3/8 thread mounted antenna for:
2m/70cm dualband [or just 2m] on the L/side and
cellphone on the R/side

does anyone have any ideas on compatible products?

thanks for your time

There is a store in my area called R&L Electronics. Same story there about the restocking fee. Their trade in price on a 2 week old Alinco DJ-5T was unbelievable! $110.00 for a radio that was "as new" in the original box. and cost $199.95. I wanted to trade up to a better unit but that was their "fixed" trade in price and they would not work with me on the trade for a much higher priced rig. They lost the sale.....

Randy.

Near mint 160-10 Meter transceiver with digital display, CW filter,
operator and service manuals. Very low hours...it still has the original
final tubes. No problems, a few documented reversable mods added from
Kenwood and HR. Two BNC connectors added on back to allow external
reciever. Asking $350. Local pickup in the Detroit MI area preferred. I
am the second owner (non smoker) and have had it since 1983.

Why should a merchant allow you to take merchandise home and then return it for a full refund? I'm confused!

I'm sorry to see complaints about the unwillingness of a merchant to give a full refund on merchandise that someone decides they don't want. I am NOT a merchant and I have NO CONNECTION with the store mentioned but it's the obligation of the buyer to know AHEAD OF TIME what the rules are for returning merchandise.

Aren't we all adult enough to decide AHEAD OF TIME if we really want to buy something and not do so until we've made up our mind? How does one know that something doesn't meet their needs without REMOVING IT FROM THE BOX (as claimed) and why wasn't that determination made BEFORE buying it and walking out of the store with it? Most ham dealers will open a piece of gear and demonstrate it if you're a serious customer. Don't you think that the merchant needs to spend time with what you've returned to make sure it's complete and really working and that you haven't damaged it accidentally? They're in business to make money not lend gear! How would YOU like to buy that same item thinking it was new and discover that a previous person returned it with some hidden damage that only appears a few days later?

I'm afraid I don't feel at all sorry for somebody who's told they need to pay a restocking fee. I wish other stores would do that and maybe I wouldn't end up with a used piece of equipment missing parts and manuals when they reseal it and claim it's complete and try to sell it as new because some customer can't make up his mind and returns it claiming it's unused!

Act responsibly and buy it only when you KNOW you really want it, are willing to pay for it and don't take it home to try it out. The merchant has to make a living and isn't running a lending library!

Stop crying about your inability to think ahead and take responsibility for your own actions. I would think the post is a RECOMMENDATION to do business with a merchant that doesn't take back USED merchandise and try to resell it as new to prevent taking a loss on it.

My $ .03 worth! (I'm too wordy!)

I understand your frustration with getting your tube filled HAM radio gear repaired.

I am sure you can find a great repair person by asking around with some of your local ham buddies or looking in the back of QST magazine.

I am sure you would run into the same type of problem if you took an old car into a dealership for repairs, they would not have the know how to work on an older model and would probably ask you to take it to an independent service facility.

Looking to buy Motorola STX radios and parts.

Need a couple full keypads and displays, and radio tops with subfleet knob.
Also need 3 speaker-mics.

Also will purchase working radios in good condition.

Jim

What better way is there to start off your morning except by drinking a cup of coffee using your very own CALLSIGN MUG. See at http://home.earthlink.net/~jawjabber
All mugs are made with quality control in mind. They are dishwasher and microwave safe and if after you receive your mug you are unsatisfied just send the mug back in its original shipping container and I will refund you the cost of the mug. See at http://home.earthlink.net/~jawjabber for details.
If you what to buy your personal callsign mug all you will have to do is send a check or money order for the amount of the mug plus $4.00 for shipping. Remember to send your callsign so I can place it on the mug.(The mug you see on my web sit is just a sample mug. Your callsign will be placed on the mug you order.) Please USA orders only. See at http://home.earthlink.net/~jawjabber
To see a picture of the Callsign Mug and to get the order forms please click on the link below.

thanks to all for the input & the price quote too
-- not sure what i go for.

i like the vx5 but its kinda spendy and im not interested
in 6m. (wish yaesu would just build a really good
rig that worked, minus all the bells & whistles -- temp,
baro pressure). the Lion batt is great.

pwr is a downer on the q7a -- but replacement
batteries are a 7-11 away. maybe a good rig
for simplex -- bike rides, camping, sailing...

best wishes -- tnx for your time

425. Re: TR2500 Backup Battery?

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-05 00:00:00 UTC
From: Rick and Theresa <pilots@mbay.net>
Message-ID: <3709CB39.B52A4FD1@mbay.net>
Source record: 111634

Per the 3rd edition Kenwood TR-2500 service manual, the backup battery is a type "BR-2325", KW part number W09-0323-05. Also goes by more common Lithium battery designation CR2032, nominal voltage 3V, nominal capacity 170mAh, diameter---20mm thickness---3.2mm. Has solder tabs and insulating disks to cover both sides of the battery.

Case opens after removing small screws that fasten case halves and few screws on bottom of unit that can be accessed with battery pack removed. Should be able to spot the battery---only one inside!

> tia -- msb

>>>>>>>>>>>>>>>>>>>>>>>> <<<<<<<<<<<<<<<<<<<<<<<

Well, where do I begin? I actually bought mine to use at work as a 'sniffer' for RF leaks. As a receiver, it is OK. Frankly, for all the bad comments on sensitivity of the VX-1R and VX-5R against the Icom Q7A, the Yaesu comes out on top in both sensitivity and immunity to intermodulation. The triple comversion of the Q7A does not seem to help it much in practice when it comes to EITHER intermodulation or sensitivity. By the way, I evaluated each of the three radios on the SAME antenna and under the SAME conditions, so there are really no variables other than the radios.

Now to the transmitter. You will find that 300 mw is JUST barely inadequate for repeaters and simplex. the 500 mw the VX-1R puts out is usable (and you get a whole watt by feeding the radio 6 vdc - unlike the Q7A). Its too bad, as this would be a really nice radio, if, like the VX-1R, you got something more by connecting it to a higher voltage. You don't. What's even more surprising to me when I consider Icom's usual conservative specifications, is that the little radio does NOT put out what Icom claims. At least mine does not. I get most output with the lithium 1.5 volt AA cells that RS sells (they are made by Energizer and cary the Energizer label). With those, I do get 300 mw output on 2-meters. However, the output on 450 MHz is down to 230 mw. What's even worse, with the included NiCad AA cells, the output (only with fully charged cells) on 2-meters is barely 220 mw and on 450 MHz its only 150 to 180 mw. You will find this is not enough RF power in most cases to do much, unless you have a very 'gainy' antenna! It will not even pull in the COR in most commercial amplifiers sold into the amateur market, so don't plan on gaining more power with an external amp! Even a voltage doubler on the COR rectifiers is not quite adequate in a 50-ohm system to produce enough voltage to bias a switching transistor into saturation to pull in the COR relay.

I'd like to give you better news, but I'm only presenting the facts on the unit I bought about 6-months ago. I still have it, but prefer the Yaesu VX-5R for hamming.

Dave - W6LEV

These are my LAST words on this subject.

Mr. Lorentson , you were offered 4 times to return the rig, and EACH and every time you refused. You have made the ASSUMPTION that I knowingly and with "Malice of Forethought" sold you something that was/is defective. If you think I kept your e-mails from a year ago, you are mistaken, as after hearing nothing from you for 2 separate periods of over months, I deleted
them. You cannot seem to accept the fact that the damage may have been caused in shipping, ONLY that I sold you something that was defective.My offer to have you return the rig was ignored, unless I return your money first.No-one that I know or have dealt with would accept this scenario, especially given the fact that you have never even explained what the problem with the rig is.The fact that you seem to be faultless in this matter is quite strange, given that most people who complain about buying a defective radio XX-110 from "Joe-Ham" who "Ripped them off" and Won't answer e-mails or any other communication , is NOT the case in this situation, I had even offered for you to return the rig EVEN a YEAR after you had purchased it. So don't make me out to be some sort of crook. Regardless of what you might claim, I do not have any of your e-mail prior to last week, and YES I made this public, You see you CAN'T

have everything just the way you like it to be and neither can anyone else, myself included. But the STANDARD procedure involving returning merchandise , is that the item be returned and then the money is refunded. The fact that you have refused to follow this established and accepted procedure is your choice. I have sold items from Greece to Singapore, and have had in nearly all cases outstanding response to the items I sell. Contrary to what you might think, I do take this very seriously, and if this were not an International forum, I would have you in court for defamation of character, posthaste. So go ahead and do what you feel is right. My question now is this, How many people will be selling you items after seeing this?
The following is a list of examples showing your desire to come to an agreeable solution to this matter:

1. Refusal of return of the "Apparently Defective" Equipment.
2. Refusal to provide a Description of the problem.
3. Refusal to accept that shipping might have been the cause of the defect, which I can neither confirm or eliminate as the source of the problem as I don't have the equipment.

4. Demanding that established protocol for the "Acceptable Conclusion" of this matter be changed to your liking.

5. Public insistance that I am a "Fraudulent" Business person who lies.

I could go on , but I choose not too. So continue to make your claims , stamp your feet, do what you like.

After all it's gotten you this far in a year, just think where you will be in 3 or 4 more years. 73 and have a nice life .... de Jordan...

WD40 *is not* an electronic cleaner and should not be used on electronic or electrical equipment. You might get away with it but why would you want to try when there are perfectly good contact cleaners available? In addition, WD40 is flammable and *could* cause a fire if you use it around contacts that may arc. My son-in-law ruined a good alternator by spraying WD40 on the armature trying to lubricate the bearings.

Jim:

Good luck on the plotter. I have one in similar condition and I don't think I could give it away. The problem seems to be no readily available software drivers that work with Windows and the fact that color B size printers are now available...

I own a Yaesu FT-8500 dual-band mobile. Is there any way to search a signal from a repeater to see what CTCSS (PL) tone is being used. I looked all through my owners manual, but I couldn't find any info about it.

Howdy Hugh...."Redifon" is (I believe they still are active) a UK company which provided lots of varied communications gear to the maritime mobile service....(and other services I believe). The receivers may, however, be rebadged Eddystone's, ITT MacKay Marine etc....as is the case with lots of marine equipment providers. I'd suggest that your friend provide as much info as possible...model and serial number....a GOOD and COMPLETE physical description and work from there. Approximate age would also be helpful. Best of Luck....Now if I could just find a NOS Marconi Apollo for my shack....heheh

Just another reminder of this upcoming event! We still have swap tables available!

The Eastern Idaho UHF Society will be hosting a hamfest/computer swapmeet in Idaho Falls, Idaho, at the Elks Lodge on April 17th. This is an ARRL sanctioned hamfest with full license testing, swap tables, commercial, and a talk on the FCC licensing and ARRL, DXpeditions and the internet and ham radio.

We have a web page - http://www.srv.net/~wa4vrv/hamfest.htm

Hope to see you there!

For sale....

GE MVS mobile radios, combination NPU-30..

Radios are synthesized, 16 channels, 25W output, front mount
units.

Radios do PL and DPL, and are scan models.

Radios are in excellent condition, and come with microphone
and mounting bracket, programmed and tested per your requirements.

Can provide jpeg image if you are not familiar with this model.

Radios will program and perform well down to about 453 mhz, if
your channel needs lie between 453 - 470 mhz.

Asking $95 each + shipping.

Thanks

Steve-WA6GSD

463. FS: Henry C130A30 VHF FM mobile power amps

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-05 00:00:00 UTC

Source record: 111712
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment

For sale..

Henry VHF FM mobile power amps..

Units require 13 VDC to operate, and specs are 20 to 40 watts
input for maximum of 130 watts output.

I have tested these units with as little as 5W input, and they
provide a stable 25 watts output with that input power.

Units can be tuned from 136 to 174 mhz, and provide full output
over any 4 mhz split within this range.

Asking $85 each + shipping, tuned and tested per your requirements.

466. Tektronix RM-45A scope query

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-05 00:00:00 UTC
From: Will White <wcw@asu.uswest.net>
Message-ID: <37097535.368C19A@asu.uswest.net>
Source record: 111715
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.boatanchors

I have an opportunity to obtain a Tek RM-45A scope for $45. It takes Type CA plug-ins, whatever that means.I have seen these (the scope itself) in Surplus Sales of NEs catalog for $175, so it looks like I may be getting a really good deal. Also, the unit appears to have been very well cared for. It came out of a university science lab just last January.

What should I check before plopping down my money? Can anyone tell me what the tube line-up in this unit is? I understand that the RM-45A is the rack-mounted version of the 545A, so if this is correct info, that should mean the two models are electrically identical or at least very close. It is very definitely a boatanchor, at about 50 lbs. and the size of a window-mounted air-conditioner!

This scope is more than 25 years old, so what is the price/availability of replacement CRTs should I need one in the future? I will check to make sure it has a trace before I buy it. How specifically do I evaluate the trace/CRT for quality/condition? Other simple tests and/or check points that are recommended?

That's a lot of questions, whew! Thanks for reading this and double-thanks for your replies.

471. Re: W32A antenna problem

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-05 00:00:00 UTC
From: rlindzen@mit.edu
Message-ID: <37093020.13677989@news.mit.edu>
Source record: 111720

I called ICOM and was informed that this was a feature not a bug. Apparently the receiver overloads when any antenna better than the rubber ducky is attached. Thus, my Larsen antenna and Maha booster are useless. I wish someone at AER had warned me that handi-talkies could no longer be used as mobile rigs. I suppose one could add an attenuator, but then one would be stuck with attenuator on transmit.

Useful suggestions would be welcome. Alternatively, is anyone interested in a W32A and Maha booster?

477. Anyone have a IC-706MKII Modified OPEN TX?

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-05 00:00:00 UTC
From: jhulet@aol.com
Message-ID: <19990405051417.17318.00002765@ng122.aol.com>
Source record: 111726

Hello,

Does anyone out there have an ICOM 706MKII that has been modified for the extended TX? What is the TX range and what are the power out? Can you transmit on the VHF marine bands...Marine SSB frequencies??

I remember there was a web page out there that showed the power outputs of a MKII or 706 when transmitting on certain bands.... when modified for out of band tx... do you remember one?

Thanks!

Jason S. Hulet

>
> Dick Lindzen, KA1SA
>

Dick:

You're not doing anything wrong. The W32A is "peaked" for the rubber duck.
When a high gain antenna is connected, such as a 2m beam, the stronger
signals cause the front end to reduce sensitivity. This is commonly called
the "desense" mode. I have a W32A and it does the same thing. BTW, I like
the radio.

Hi there! :) I am looking for the following musical equipment from 1950-1990, working or BROKEN, in any condition:

-OLD SYNTHESIZERS
-OLD KEYBOARDS
-OLD DRUM MACHINES
-OLD VOCODER
-OLD EFFECTS
-OLD ANALOG SEQUENCERS
-OLD MIDI gear
-any MODULAR / PATCHABLE SYNTHESIZER

Moog, ARP, Sequential, Oberheim, Roland, Korg, EML, EMS, Buchla, Serge, Synton, Digisound, Voyetra, Steiner-Parker, Octave-Plateau, Gleeman, Paia, PPG, Aries, anything similar, especially more unusual stuff.

To get a better idea of what I'm looking for, take a look at:
http://members.aol.com/rolandman1

Roland TB303 Computer COntrolled Bassline
ROland MC202 Microcomposer
TR-909 MIDI Rhythm Composer
TR-808 Rhythm Composer (black with multi-colored buttons)
Polyfusion 200 Modular
Roland System-100m modules or full system

Please email me privately at rolandman1@aol.com if youve got anything like the above or know someone who might. Thanks in advance, sorry if this message distrubs anyone.

The Q7A is a fine little radio. Overall sensitivity is good, although not quite up to the level of the W32A. Ease of operation is good also, despite its lack of buttons. The audio quality and quantity both get an excellent rating. Scanning rate is fast. One gripe is the volume up/down buttons are too small. Also sensitivity around 46 Mhz (still some police/fire xmtrs down there) is not good, maybe the supplied duckie is the problem.

Source record: 111731

J,

Take a look at
http://radioamateur.com/icq7/page2.htm

First, you have to gain access to the diodes.
Then remove them, and reassemble the radio
(usually). There is risk of damaging something
at each step, from a screw, to lifting a pad.

The Q7a mod is just one example but many of
the smaller rigs use SMT. If you are not
experienced w/ SMT rework, your risk is increased.

your mileage will vary and the fuel $ will be high,
msb -- imo

Jeffrey Herman wrote:
>
> Give 'em a bath in denatured alcohol or acetone. Do so in an open area.

Acetone may attack the plastics in the case. Alcohol will clean some
of the grime but not all.

The idea is to clean the oxides, grime, and non-conductive film from the
contacts, and leave a lubricating layer to prevent galling of the
contacts. The lubricating layer also prevents re-oxidation and the
formation of non-conductive films that caused the problem in the first
place.

The lubricating film is non-conductive, but the microscopic asperites on
the surface of the contact will punch through the film and provide a true
metal-to-metal contact. This can reduce the contact resistance by a
factor of ten and make it much more stable.

For example, "Fix Modem Problems",

http://www.csolve.net/~add/system/modemtip.htm

shows how ordinary vaseline can reduce the contact resistance on your
telephone.

Simply cleaning the contacts may provide temporary improvement, but
without protection, the problem will soon return.

Best Regards,

Michael R. Monett,
Automated Production Test

Wow, some one must own stock in WD 40! In the Pro audio world, the caig cramolin r5/d5 is defiantly the way to go. I would not get caught dead spraying
WD 40 in an expensive mixing board. Leaves too much residue. I have seen boards with "customer repaired" using WD 40 with puddles of goo inside. A good
cleaner should clean and preserve. This leaves out just alcohol or other straight
petroleum products. If you clean a control in this matter, it will soon be noisy again.

Notes on cleaning switches:
If the switch is a knife type with a steel case, try to pry the back cover up to
expose the end of the switch slider. Put the switch in a vertical position and spray
D5/R5 in and work the control for 1 minute or so.
If the switch is a sealed plastic type..Do this only if there is no other choice.
Get a small shafted pencil soldering pencil. Burn a small hole with the pencil in
the back of the control. Make sure you work the control back and forth so none
of the melted plastic jams the control. Spray D5/R5 in the new hole. You then can
seal it with a dab of silicone sealer or equiv.

> It is a one-way commercial broadcast from the satellite to earth
> on 145.80 - 146.0 MHz.

We don't have to stand by and do nothing, do we?

One idea is to create phasing distortion adequate to render
the received signal unintelligible (bouncing our signals off their
satellite would cause two signals to be received at the same
time on the same frequency with different content). I suppose
we could also find the control signal and jam it so they cannot
turn the ridiculous thing on. Or could we find their most valued
VHF frequency and bounce a mixing frequency off that same
satellite so that the resultant frequency would jam their receivers?

Let's get creative folks ... in addition to complaining ... it's more
fun to speculate as to how to prevent it by being clever! :-)

Hmmm ... how low is that thing going to be flying? Perhaps
a weather balloon and some C4? ;-)

Since the wonder-kid Clinton has led NATO into bombings in
direct violation of international law how can we now criticize
anyone else for ignoring international law for personal gain?

>and cost $199.95. I wanted to trade......."
How much would YOU be willing to PAY for a traded in item that costs
$199 new. I would not pay more than $100 - $125 for the used one even if the
salesman told me " it was only used one sunday by a little old lady who brought
it back after 4 days". That trade in price seems fair because that store can't
turn around and sell it for much more, unless they are dishonest and try to
pass it off as a never sold unit. It all boils down to simply asking the
question "what if I don't want it anymore after a week" instead of trying to
second guess these store policies after the fact.

Nothing in the VX-5R is "blocked". Everything it was designed to recieve is already included, other frequencies, (ie- cellular, 27Mhz CB ect.) are not sitting in there "blocked".

Yes, I have done this. As there are different 706's even within the same model I would recommend you contact ICOM NA in Bellevue, WA and speak with customer service - provide them the legitimate reason for out of band mods with proof (mine was NAVY MARS) and they will tell you how to do it for your specific serial number. I understand that if you mess it up, and have no legitimate reason for moding it, they won't even look at it in their repair facility then you are seriously SOL.

As far as using it for things like Marine freqs outside of HF I would be careful. The filters, especially on the MKII models are pretty tight and your might not like the result, if not the poor performance. While the radio was designed well for HF opps - the VHF portion is meant only for ham band opps. I think you'll be better off buying a dedicated Marine Radio. Don't know for sure but wouldn't the Coast Guard frown of this sort of thing during inspections - using a radio that isn't type accepted?

I guess the more appropriate way to say, in your situation, is to "remove or disable the functionality of the diode". You can simply clip break the diode, cut the diode's wire that's soldered on the board, de-solder the diode, cut the copper trace, and etc. Do whatever you can to disable the diode __ A L O N E __.

Diodes come in many forms and shapes. I guess the hardest part probably is to identify the correct component. In case the instruction is not clear, stop proceeding to the next damaging step immediately and seek consultation. Good luck.

Very nice little radio. Limited power (uses 2 AA alkalines), but nice size and functionality.

Gave away my VX-1R after buying this one.

Nice plus is that it does very well on FM broadcast.

Well worth the price.

Phil

> Has anyone had this or Similar problem????

Mine has done it a couple of times, I've read post before someone stating the same thing. As far as I know, there is not a fix, other than be sure that the contacts on the display face are clean of oils, fuss, lint, anything that might give a flaky contact. My radio locked up, year or so ago, had to pull power, same condition your reporting, and it wouldn't come up. Removed the display cleaned it, and put a small amount of DeoxIT D5 contact enhancer, excellent stuff for contacts, connectors, and I haven't had a pronblem to this day, and I leave the display attached allmost all the time, I was taking it off and on more often then. Hope this helps, Zac...KF6ATH

Good day, all!

Is it possible to modify the VX-5R radio to transmit in the UHF commercial business band?

If so, where can I get the information?

In the past, there has been a lot of good information on the FT-50's modifications, so I am hoping this will also be the case for the VX-5R.

Thank you! -Mike

What problems are you having with the DSP-2232??? The only mod. I'm aware
of is one to slightly increase the output signal, but this is only needed if
you can't get the proper FM deviation by adjusting the pots. In general the
unit works great "as is."

Unless they've changed the way they make the keypad, the numbers
will just rub off again. You can write the numbers on the keys
with a small Sharpie then cover it with clear nailpolish. I have
to do that to mine every year or so.

Use a pair of small dykes and cut the lead of either end. Leave the diode in place just in case yu want to restore it.

Just recieved my Q7a last Tuesday.....had it a week and am still being impressed with it.....will replace my Beloved Standard C-508a which was a wonderful little "Stealth" radio.....but the Q7a will recieve low-band(30-50MHz),which makes it ideal for the area I live in(we still have 33 MHz fire depts). Sensitivity seems OK- I do think the antenna could be improved on,but whatever you get will be a compromise,considering the broad coverage.....
Audio is a bit louder than the C508,there are 3 times the memory channels, (200 as opposed to 60, ease of use.....well, if I hadn't had another similar rig, I'd still be going bbbbbbbbbb.....is comparable to the C508.....but the most impressive feature is the price!! AES Brand new INCLUDING 2 AA nicads/charger =$179.00 .

522. Heathkit IO-4560 Schematic Needed

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-05 00:00:00 UTC
From: datapro1626@my-dejanews.com
Message-ID: <7eb3o1$96g$1@nnrp1.dejanews.com>
Source record: 111771

Looking for some help with an old Heathkit IO-4560 oscilloscope. I used to be a design engineer at good ol' Heathkit back in the 70's, and as such, I was recruited by my kid's science class to fix their ailing Heathkit scope. It is a model IO-4560. I don't have a schematic or a book as they bought it second hand. The problems seems to be at the low level input to the horizontal amplifiers. The drivers seem to be ok, as the dot will center when I disconnect the input to the amps.

Any help would be greatly appreciated. I only really need the schematic not the whole book.

Thanks and Regards

I agree - when I purchase a 'new' item, I want it sealed, in it's box, from
the factory.
No sticky fingers on it for me, thank-you very much!

Am I the only one that paid close to $1800 for the 746. I bought mine
before the first of the year and that was the going rate. This was
before coupons. What are they going for now.

I have a Kenwood TM-733A which just starting having a LOCKED up
DISPLAY.......The DISPLAY indicates --ON-- and can not be changed,
or programmed. The power must be removed in order to shut Down the
RADIO.... Can NOT do a RESET or INITIALIZE.
Has anyone had this or Similar problem???? Does Anyone know
the fix for this LOCKED UP DISPLAY?????

Appreciate any HELP!!!

>> Factory Service Tech and it beat everything else.

For the life of me, I don't see how anyone can have good results CLEANING switch contacts with a petroleum based lubricant. LUBRICANT is used to lubricate.... that is, it leaves a slick deposit to reduce friction of parts that tend to rub together and protect parts from air and oxidation. CLEANing solutions are designed to clean contacts; that is, remove all dirt and residue from surfaces. This is just the opposite of a lubricant. You can't have both unless you use extremely expensive conductive grease type materials. WD 40 is not a good conductor. I would not want to coat small fine switch contacts with this material.

Off-the-shelf TV tuner cleaner would be about the most easily obtainable cleaner you might find.

Personally, I have found in 30 years radio maintenance that the most reliable fix for an intermittent switch or pot is to replace it. Digikey is a good source for both.

I agree! Except stick with TriFlow. The contents have a much lower vapor pressure and the fix lasts for years. It is miraculous on pots, too. I suspect the antioxidants help. If you want a surprise, try it on motor brushes! I expected a burnt mess but the sparks disappear and the motor speeds up. I haven't seen any long-term downside yet - and I spray that stuff everywhere. :)

John Miles wrote:

Message-ID: <37084899.8E516E79@qsl.net>
Source record: 111816

Hello,

I recently purchased a Kenwood TS-450. I want to get a CW filter
for the radio. What is the practical effect of installing the
8830 kHz and/or 455 kHz 500Hz filters? My previous radio only
had a 455 KHz optional 500 Hz filter. So, I don't know which
one (or both) to buy.

I will start with the part where you ," Resent very strongly", but I
notice not enough to send me back my money.
I have been surprised at the number of hams that are not "confused
about who you are.
Remember what I said about how hard it is to remember what you have
told people when you lie. If you memory is this bad, you should not
be tell ing lies. I have your emails idiot..........
I never said I would forward email addresses to you !!!
"" You are of the
>"impression that I knowingly sold something to you that was not in good
>working order. "
I have a strong imrpession of what you are, YES!
If you will think back a week or so you will see you made the Posts
publicfirst..... cannot you remember anything.?
I don't care if you post in public or not, but I think I will
everytime I see you name. and jordan, you have a good day.

Hello,

I have a regular manual for the Yaesu FT-50R handheld. I purchaesed this manual new when I had thought I had lost mine. After getting the new manual I of course found my old manual....go figure!

I have sold my Yaesu FT-50R and along with it the original manual. I still have the manual I ordered new and it is mint as can be, pages are not bent, no smudges, perfect.... never used it to look up anything...

$12.00 and I will ship it...

I think I paid $10.00 for it when I got it.... The $2.00 will cover shipping package, ect...

Thanks!

546. How do you remove "DIODES?"

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-05 00:00:00 UTC
From: jhulet@aol.com
Message-ID: <19990405045412.17318.00002760@ng122.aol.com>
Source record: 111825

Hello,

I am wondering what is involved in removing diodes? Say if someone was to modify a radio and it required a couple of diodes to be removed.... First, what tool would be used and what special features would one want in this tool? What is the "hard" part in removing the diodes? Is is just a matter of using a fine tip soldering iron and heating the diode contacts and removing the diode?

Is seems that so many modifications out there today require the removal of diodes that I am considering learning the trade...

Thanks again for any light you can shed on the subject...

Source record: 111527

We must both be stupid, for I have been wondering the same thing. I have a 930SAT with no dimple on the knob. The paint on the front of the knob is all worn off from spinning the knob from a different spot each time. The dimple would keep the knob looking nice. If you locate a source for a new tuning knob with a dimple, let me know. The knob is the only ugly spot on my rig.

Source record: 111530

FT1000d has worst cw qsk, most versatile dual receiver, most expensive

FT-1000mp has better qsk, expensive filters, good selectivity.

TS-870 by far the least expensive, no filters to buy, poor selectivity, best cw qsk and keying, best computer interface by far, best rx and tx audio for AM or SSB.

For general use, I would get the 870
For heavy contest use, the MP
For real dual receive the 1000d

For real cw work a 20 year old TenTec

Source record: 111531

The Omni VI has the edge for cw recption. The FT1000d has more features. The Omni VI has poor cw keying. The FT1000mp might be a more comparable rig instead of the D model. The D has dual receive and really runs up the cost. The MP is better than the D on cw QSK.

Source record: 111534

I was planning on using this device with my Pro 2006 scanner. I have the "FM Discriminator" mod completed and was wondering if I could plug that into the Hamcomm HCD214 interface? The hook-up instructions I saw at the web page (www.radioamateur.com) said it could be plugged into the speaker jack for it to work. But, I have read here and in other newsgroups and web pages, that you have to use the "FM Discriminator" to be able to properly decode the signals. Please post or email your replies and any advice/help is greatly appreciated!!

Source record: 111535

Your friend hasn't a clue OR he has the worst power meter in the universe.
Probably both.

ie:To get 500w on 21 mhz @ 60% efficiency would require over 800w
input(didn't use calculator). 800w input with a 14v supply indicates a
current draw of over 60 amps.(Rough figures guys).

The finals aren't capable of it and I doubt you had a power supply that
could do it either.(Off top of head finals rated at 180-200 w each absolute
max.)

Hi Art,

I have both MFJ and Autek. Autek are smaller and so go on most
of my trips. The new MFJ does a bit more than the older Autek
I have I bought the package deal of HF/VHF/UHF because I operate
in all those bands. I like both I find myself using the MFJ-259B
more than the others at home.

The accurace of both systems for the price is amazing. I have
checked them against an HP network analyzer that cost almost
as much as my house and they did very well. Hope ths helps.

Jerry

You'll find what you're looking for in the NIST website:

http://physics.nist.gov/MeasCal/contents.html

it's about half way down the page in the "NIST Time Services" section. You
can sync you computer by connecting directly to the NIST atomic clock, or by
using the internet.

Good luck,
Richard

Don't use WD-40 on anything that is high impedance. It conducts. I once sprayed it in the guts of a marine SSB transceiver and it killed the unit. I had to bake it for days in low-temp oven before it worked again.

I have seen radios come in where the customer used WD-40 to " dry "
the radio where is was submerged. The shop generally sends them right
back un repaired as they are a mess to attempt to repair after that
treatment.

Have used WD-40 to dry wet automobile distributor caps though and it
worked fine.

572. band limitation for commercial Sony 7600

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-06 00:00:00 UTC
From: leo <parking@tin.it>
Message-ID: <7eddng$2te$1@aquila.tiscalinet.it>

A friend of mine bought a Sony 7600, which has some band limitations due to restrictions in Italy where he bought it.

Does anyone know how (and if) it is possible to modify it to remove those limitations? Is it a matter of hardware or software modifications?

Thanks!!

leo

Most switch contacts are self cleaning if they switch enough current - the arc cleans them. However, sometimes when used in a very low current application they do get oxidized. I've had good luck by removing the switch from the circuit and putting it across a CURRENT LIMITED supply set at about an amp. Exercise the switch a few times - you'd be supprised how well it works.

>If a Ham Radio Operator home builds a ham rig to operate on the ham bands does
>the radio have to be "type accepted" by the FCC???
>
>Jason S. Hulet
>W1WOW
>

Actually the amateur radio manufacturer follows the exact technical specifications a hombrewer does for HF transmitters and HF receivers. Manufactured low band amplifiers (1.6 to 30 MHz) are Type Accepted to show they can not transmit in the 24 to 29 MHz range off the shelf. All amateur receivers that operate above 30 MHz must pass FCC Part 15 rules for receiver radiation. Most all amateur receivers that operate above 30 MHz are tested as a scanning receiver since the transmitter is not tested for spectral purity other than by the factory, who does submit a statement showing the test data at Type certification time.

The manufacturer, as does the hombrewer, must follow the spirit of the law, so that is why you do not see manufacturer radios that transmit from DC to daylight off the shelf. Also there are other troubles building a rig that is wide open as the FCC in the United States does require transmitters in other services to be tested for spectral purity.

Most amateur radio manufacturers will insist you provide a MARS or CAP license before forwarding a transmit modification. Why ? The MARS and CAP operators are governed by the NTIA, the FCC has nothing to do with MARS or CAP and the equipment they utilize. The NTIA has recently stiffen up the standards for equipment, for CAP it is now suggested those operators step up to Land Mobile produces as they better meet the technical requirements of the NTIA

Once you remove the transmit inhibit devices in an amateur radio you should also remove the FCC ID number as the product is no longer an " approved device under the FCC rules.

Lastly in conversation with the FCC I had that using a modified amateur radio for transmitting outside the amateur bands is illegal in the United States no matter for what purpose. It is not necessarily illegal to own a modified transmitter just do not use it outside the amateur bands.

Hope that answers you question above.

Is the radio still under warranty? I'd take it back.
My 1st 8100 was missing 2 icons, and the PLL
wouldn't always lockup on both bands, the 2nd one
would take 5 minutes to warm up before the PLL would
lockup on both bands, then when transmitting, the xmit
and rec would both unlock and the recv. audio would mute.
it would take 10 minutes to reset itself.
I finally told my dealer that I need
to switch brands. Got a Kenwood instead.
Good Luck
Duane

The purpose of this post is two-fold. First to protect others buying amateur radio equipment via the internet, and secondly to generate any information that may be available on the following person:

Scott T. Word KB5SLY
13216 Brandywine Road G
Brandywine, Md. 20613

The Backround:
KB5SLY posted forsale on the Virtual Hamfest site, a FT1000 transceiver. He was mailed a bank money order for the amount of $1,850. Mr. Word cashed the MO but has not delivered the equipment. He has had the listed phone disconnected and does not respond to email messages.

The ham involved in this matter has been in contact with federal and state(Md.)
authorities and has supplied both with copies of email exchanges and the cancelled check (including the signed back).

If you see items posted forsale by this individual, don't think of dealing with him or if you have any information that you think may be of help, please email wd2k@capital.net

592. Re: Question about TM-V7A

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-06 00:00:00 UTC
From: Rick Pemble <pemble@earthlink.net>
Message-ID: <7ee5a4$c4h$1@birch.prod.itd.earthlink.net>
Source record: 111607

I have had the TM-V7A since June last year. Have the front panel mounted right next to the CRT I am typing on now -- it stays on 24hrs. I never noticed the problem you mentioned -- Until I checked that is! Mine does the same thing -- never noticed it. If you hold the MHZ button in for greater than 1 second, it is supposed to toggle back and forth between AM and FM. If it is AM you get a hyphen (_) instead of a period between MHZ and KHZ. Well, you are right, doesn't happen on the UHF side (when it is switched to VHF). I monitored the airport, and it only demods AM when the signal is so strong it slope detects (in other words, that side is stuck on FM).

SO, it looks like that is the way it is out of the box. May be a way to change it, but I couldn't figure it out.

good luck.

Rick W4RP

Hello,

I'm listing this for a friend of mine who has an Alinco DJ-F1T HT and only has one battery pack for it.

The pack that he has is an EBP-18N (12-volt) and he'd like to get a spare pack, or maybe two if the cost is reasonable enough.

My friend would prefer the EBP-16N (7.2 volt) pack, but he'd consider any size or rating that was designed for the DJ-F1T.

Contact either my friend Jack at the following e-mail address, or myself at the second e-mail address if you can help him out:

nz9u@tds.net (Jack)
KA9WDX@webtv.net (Myself)

Thanks in advance, 73 and CUL,
Bernie

Is anybody aware of a amateur retailer that sells ham gear with extended
>warrantees. I buy all my electronics with entended warrantees as a
>matter of good sense. Is this available with amateur gear?? 73's
ALINCO offers an additional year of warranty on all their rigs
for an extra flat $40
Many credit cards will also double the warranty if you purchase the rig on
their card, but if you do need a repair you must pay for it & then submit for
re-embursment

600. Timewave DSP-232 Questions

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-06 00:00:00 UTC
From: DavidC <davidc@bit-net.com>
Message-ID: <7ee6vp$nf4$1@news2.bit-net.com>
Source record: 111615
Cross-posted to: alt.ham-radio.packet,rec.radio.amateur.digital.misc,rec.radio.amateur.equipment

I bought a Timewave DSP-232 at the end of 1998 and due to
a variety of issues have yet to fire it up. There were a number of
limitations to the advertised features at the time and fixes were
promised ... and mods and workarounds were expected to arise
from within the Ham community.

The unit has now been discontinued (it was actually a
dysfunctional piece of the inventory Timewave got from AEA --
and this stuff almost bankrupted Timewave since it wasn't ready
for market as they had expected).

Timewave's representation of the DSP-232 is found at this
url under "Discontinued Products":
http://www.timewave.com/amprods.html

I don't blame them for bailing on this device, it was a
real black hole of technical time for them ...

Is anyone aware of non-Timewave supported mods and
workarounds for the fullest possible functionality? Is anyone
aware of non-advertised upgrades?

I have also written Timewave but those in the Ham community
who are actually using a device are often the best informed!

Thanks! & 73,
~~~

I really don't think that comes close to the ARRLs equipment insurance rates, and theirs is a "no matter what" I think I pay 1.50 per hundred per year for replacement/repair from theft, fire and ightening, ANY damage, something extended warranty won't do. Check it out.

No joy from here -- but I think it's because the gw to the ampr.org is
designed to not allow traffic to flow. Here is a traceroute from me to
your address (I've lopped off the first few lines which are not
relevant to the discussion -- they just show the hops before the trace
got out into the 'real' internet).

I know very well about the Fusion...though that's not quite the same thing
as a diamond monster. Actualy, it's a pathetic excuse from 3DFX to immitate
NVIDIA. It shows how little you know to be reccomending that over one of
the TNT cards. You should realize, being a reseller and all, that very few
ppl bought into the diamond cards.

Oh yeah, and while we're trying to make people look STUPID...why not check
the price of the Diamond Monster Fusion you have listed on your
(ahemCRAPPYahem) web page. It certainly is *NOT* listed for $125.
Jeesh...some people thing just because they can use frontpage they're
qualified to run a web business.

620. Stupid Kenwood Question

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-06 00:00:00 UTC
From: tom <tsokol@injersey.com>
Message-ID: <7ec07hcgl1@nw003t.infi.net>
Source record: 111645

I know this is probably a stupid question, but does anyone know why the main tuning dial on some Kenwood rigs have a "thumb" recess and other rigs do not? I have a TS-140S and a 940S/AT and miss having a thumb dimple for tuning. I know that some rigs have "variable rate" tuning and Kenwood may have chose not to put such a dial on those rigs, but even that isn't consistent. Just wondering. Maybe I can order a "dimpled" dial from Kenwood Parts....

622. Next batch of "Diode" removal questions... =)

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-06 00:00:00 UTC
From: jhulet@aol.com
Message-ID: <19990406003209.28813.00003062@ng119.aol.com>
Source record: 111647

Hello folks,

I got several responses about diode removal and I really appriciate everyone of the responses! I failed to state that I was looking for removal of "surface mount" diodes, this would have narrowed the responses to the topic that I was looking for! =) Oh well, I did learn a little about both.

I was surprised to hear that some Hams actually "crush" diodes to remove them. I would imagine this is a permanent "removal", and that it would make it difficult to reinstall a diode back into its place. My question is, is it acceptible to actually crush a surface mount diode as a way to disable its function? The rado in question is a ICOM 706MKII and is out of warranty. I plan on keeping this rig for quite a long time, I've had it since 1997. It is installed on my sailboat and I am looking for a back-up rig that would be able to lend communication assistance no matter what the frequency in the case of an emergency while on the water. I am looking for extended tx capablities on Marine SSB as well as the VHF Marine band.

I am not experienced at removing items from circut boards, but I could manage to crush a diode or two.. (sounds funny) If I were aware of an experienced local Elmer that was willing to take my radio into his hands to perfrom this mod in a more conventional way I would like to stand by and watch it performed. I am still in the process of looking for someone or learning to do so myself.

Thanks again to all !

Hello,

Is there a procedure with the Yaesu VX-1R that allows you to make an auto-patch call? Seems I read something that said you can program a number into memory and make a call that way, being the radio has no keypad...

Thanks,

Jason S. Hulet

625. Question about TM-V7A

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-06 00:00:00 UTC
From: nexus@ametro.net
Message-ID: <7ec5st$6n0$1@osh1.datasync.com>
Source record: 111650

I have a Kenwood TM-V7A and just now decided to play around
with the Aircraft portion of the radio. I've noticed that
when I'm in dual V+V mode, that I can only listen to AM on
one side, and FM on the other side.

I wanted to be able to monitor 2 different AERO frequenices
at the same time. I don't see how this is possible since it
will default to FM on one side, while staying set to AM on the
other side.

My question is, am I missing a step here, isn't the radio able
to listen to the same band on both sides in the same mode, AM?
Or am I just stuck with being able to monitor only one AM and
one FM at the same time?

I've noticed some other problems with the radio, and just reinit
the VFO fixed it, I'm wondering if I just do a total reinit if
it would fix my problem?

Source record: 111651

The Traxar is a "cheaper" version of the 800 MHz trunked Privacy Plus Mostar. It has exactly the same electrical and RF characteristics of the Mostar. Like the Mostar it cannot operate in a conventional mode nor can it be used simplex. Value? about $30-50 may be too much.

Modification would be difficult as it designed for 806-824 MHz TX and 851-870 MHz RX. The radio has a microcontroller with internal firmaware. (microcomputer) so hacks would be difficult. You might be able to socket a microcontroller with external prom and hack it. Probably not worth the effort since the RF hardware would need to be reworked as well.

Ed WB6SAT:

You are generally quite right. But....

WD-40 is cheap, and the lighter, more aromatic components of it, when pressure blown onto a contact, will do a pretty credible job of cleaning oils, dust, cigarette tars and mouse piss. And most of the WD-40 will evaporate. But yes, there is an oily residue that remains. And this residue will hold airborne contaminants very well. So, the WD-40 does a good clean-up quickly, but it leaves a residue that actually accelerates future contamination.

Now, if we're talking cleaning a switch contact, we not only want to wash away the gunk, but we want to remove the metal surface oxidation and sulfides. The metal chosen for contacts are a compromise between conductivity, melting point, hardness, and oxide formation. Ideally, you would like a contact that deforms slightly, to make a wiping action when it makes and breaks, thus breaking surface oxide skins. You would also look for a metal with a soft and relatively conductive oxides. So tin is better than aluminum.

If you want to truly clean a contact, you need to either chemically etch the contact, or mechanically abrade it. And once it's clean, then you want to slather on some compound that keeps the contact wetted (submerged in a protective goop) to prevent contact with the oxygen in the air.

Most home jobs aren't critical enough to go the full contact renewal route. I usually wash with WD-40, then wash with rubbing alcohol (and remember, this also leaves an oil film). If I have to burnish the terminal, I'll wash it again with the rubbing alcohol, and follow up with a small squirt of isopropyl alcohol (no oil).

No isopropyl? Wet a cotton swab with high proof vodka.

Don,

Look at the specs he gave. The 823 to 849 is the cell phone transmit.
They are missing. The 868 to 894 are the cell tower transmit. They are
missing. This scanner cannot recieve cell frequencies. Do not buy it

thinking that you can modify it because you can't. You could use a down converter however. It is still a very good 200 channel scanner. I have had 2 of them and the price is very good. If you really want cellular buy a cell capable scanner to begin with.
Good Luck
Rick

629. Re:Anyone have an IC-706MKII modified for OPEN TX?

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-06 00:00:00 UTC
From: jhulet@aol.com
Message-ID: <19990406035300.17318.00003217@ng122.aol.com>
Source record: 111654

Dear Mr. Smith,

First of all I would like to thank you for your information on modifying the ICOM 706MKII. I will heed your precautions....

You seem to assume that my point for modifying my IC-706MKII was to use it as a solo radio aboard my sailboat. This is not the case. I am merely wanting to tap into this radios fullest potential so that it may remain useful no matter what the circumstances. As is in the case of a bondified emergency where all other radio equipment is disabled.

Its the nature of the Ham is it not?...to have his equipment get the task done no matter what the circumstances in times of emergency?

I guess we should all have 65mph "governers" on our vehicles(because of course most vehicles can reach a high rate of speed and we all speed right?)

Owning a handgun doesn't mean you are looking to shoot someone...anymore than modifying an Amateur Radio means you are out to transmit over your local broadcast radio stations transmittions...for kicks.

As far as type accepted radio equipment is concerned, in the case of a "real" emergency the FCC says you may use any means necessary to save life or property... I believe this would include a modified IC-706MKII transmitting on whatever frequency was to secure the quickest help in the area. I think the headlines would read "Parents and young children saved by quick actions of an Amateur Radio Operator" NOT "Amateur Radio Operator cited for "out of band" transmittion while attempting to save family of six from drownding in Lake Michigan"

If a Ham Radio Operator home builds a ham rig to operate on the ham bands does the radio have to be "type accepted" by the FCC???

Dick, Get one of those rubber duckey mobile adapter thingies that will mount your rubber duck antenna outside the car. If that is not an acceptable solution then it looks like you need to buy either a mobile rig or a cheap Radio Shack HTX-202 and use it mobile.

Works OK... Seems to be picky on 160m (power down to 200-300w).
I'd think you'd be better off with used tube unit, more power
at similar cost. To go from 100w to 500w for $1200 is a bit steep.
Be careful with rigs that provide > 100w, (ie FT1000, 1000MP, 775) -
it'll burn up the xistors in a "Flash", literally.
I know, I had someone hook their rig to my amp, and cranked up
the input power, and poof! now dead... It's been fixed, but
there is no input overload protection. Mines been sitting for
years, not hooked up. I run 100w. It's seems good enough for me
at this point and time in my operating schedules.
Vic

Hello all,

Does anyone have the following problem with the Yaesu FT8100, and if you do, can it be fixed?
On the LEFT VHF vfo - digits after the decimal point blink and nothing can be received between 201.980 to 205.995 Mhz.

On the RIGHT VHF vfo - digits after the decimal point blink and nothing can be received between 110.000 to 130.850 Mhz and between 169.800 to 247.845 Mhz.

Also, for either of the above, when squelch is turned down, sounds like unit is motor-boating.

thanks for all inputs

It is a great old 'scope and WELL worth the money UNLESS it needs fixing! The tube lineup is quite extensive (expensive, too!). If you buy this fine instrument, you may want to find a junker 545 (for parts) at a hamfest. Getting a manual might take some searching. I do not know about parts compatibility, but I have a TEK 541 'scope with manual (about the same age --35+) with bad HV and "good all else" that you can HAVE for the freight (not a really great deal, BTW).

As for the testing, you plug it in, turn it on, let it warm up, and adjust Intensity, Focus, and Astigmatism controls for a nice pair of traces. Play with the Vertical and Horizontal position controls, then make a connection between each of the vertical channels (one at a time) to the CAL output connector near the bottom of the panel. You should get a decent square wave trace, after which you can try the Time Base (H) and Vertical scale controls. If all this works OK, reach for your wallet! If it craps out later, you may need to junk it, tho... I'd be hard pressed to resist taking it home, if I hadn't bought a clean 475!

I agree. This is a bullet proof receiver - triple conversion -- very
good sensitivity, especially 800 Mhz. Used one as a remote receiver
for a repeater in a high intermod area, and the receiver was seldom
impacted by all the RF. Not bad for a radio shack handheld scanner!

Mine is the TH7DE model and this one's rx, after being opened up by the
removal of one wire, covers 118-135MHz AM (Air Band), 136-173MHz FM
and 400-479MHz FM.

Hello--

The Tek 54x scopes represent some of the finest pieces of test equipment ever manufactured. The plug-in design concept allowed Tek and a few other manufacturers considerable flexibility in designing accessory plug-ins doing everything from strain-gauge signal amplification to spectrum analysis.

The type CA plug-in was a wideband dual-channel vertical amplifier-- one of the more common and useful types. If ths scope doesn't include one, plan on spending from $5.00 to $50.00 for one, depending on where you buy it and its condition.

However, these scopes consume considerable power, are (as you pointed out) bulky and heavy, and they're well past the point where factory service and support were available.

You can still locate small-signal replacement tubes, and CRTs are also available. The real showstoppers are: range switches, power transformers electrolytic capacitors and and high-voltage transformers. That said, you can locate replacements from salvaged scopes and a few surplus dealers.

Older heavily-used CRTs exhibit 'double peaking", a condition that denotes a tube getting near its end of useful service. Check by examining the CRT's brightness as you increase the intensity-control setting-- the spot's intensity should reach a peak. If the spot brightens, dims and brightens again, you'll probably need a new CRT at some time in the future.

Makes sure that the scope's cooling fan turns freely-- lost cooling air killed a lot of these scopes.

For more info, get a copy of Stan Griffith's book "Oscilloscopes Selecting and Restoring A Classic"-- Stan worked at Tek and his book outlines differences among models and offers servie and restoration tips.

Stan's address:
Stan Griffiths, W7NI
18955 S.W. Blanton
Aloha, OR 97007

Stan's book lists several sources for components and manuals.

You should also purchase manuals-- one for the scope, and one for the plug-in. The manuals are worth buying solely as examples of good tech writing!

73,
Brad AA1IP

646. FS: VHF Gear TS-711a, Mirage 2mtr amp, IC-551d with PS.

Hello folks,
I have some VHF Gear for sale, the items are as follows:

Kenwood TS-711a 2 meter all-mode AC/DC, 25 watts, mint
shape in and out.
I need $550.00

Mirage B 2516 G 2 meter 25 in 160 out FM/SSB amp. Like new in and out.
I need $175.

Icom IC-551d & matching IC PS20 DC P/S.
Radio is a 6 mtr all-mode, 80 watts out with a very hot receiver.
Power Supply is the matching P/S for the IC-551d, and is in near mint 9/10
I need $525. for all!

All gear is 9+ out of 10.
Buyer pays shipping.
Thanks and 73's

You are correct, I assumed that when you said...

"Can you transmit on the VHF marine bands...Marine SSB frequencies??"

... that your intent was 'non-emergency' solo use. That was a wrong assumption and I apologize.

I could care less what you do with your radio as far as modifying it or how you use it to 'tap into this radios fullest potential'. My intent was to only provide information to keep you out of a jam.

Man - you took the last 2 sentences of a rather long post I made to HELP YOU OUT...

>>I think you'll be better off buying a dedicated Marine Radio. Don't know for sure but wouldn't the Coast Guard frown of this sort of thing during inspections - using a radio that isn't type accepted?

...and twisted it into some sort of attack on the fabric of Ham radio and even throwing gun ownership, the press, and automobiles in your 7 paragraph reply.

Jeeze man lighten up - couldn't you give me the benefit of the doubt given that the weight of my reply had nothing to do with your 'rights' to modify your radio.

Yes, I have done this. As there are different 706's even within the same model I would recommend you contact ICOM NA in Bellevue, WA and speak with customer service - provide them the legitimate reason for out of band mods with proof (mine was NAVY MARS) and they will tell you how to do it for your specific serial number. I understand that if you mess it up, and have no legitimate reason for moding it, they won't even look at it in their repair facility then you are seriously SOL.

As far as using it for things like Marine freqs outside of HF I would be careful. The filters, especially on the MKII models are pretty tight and your might not like the result, if not the poor performance. While the radio was designed well for HF opps - the VHF portion is meant only for ham band opps. I think you'll be better off buying a dedicated Marine Radio. Don't know for sure but wouldn't the Coast Guard frown of this sort of thing during inspections - using a radio that isn't type accepted?

While I have seen several programs hat allow our British friends to decode
their Rugby time/frequency standard station, I have never even found
a "bad" (ie one that does not work as stated) to decode either WWV(H)/WWVB.
The NIST web site has all the data on the IRGII(modified) data stream.
Good luck

From what I've read on the YAESUVX5 mailing list on OneList.com, there
is some discussion as to there being different CPU's in each
international
version of the VX-5R. The CPU for VX-5R's sold in the North America
have a CPU designed NOT to receive al those restriced frequencies.
There have
been reports of other versions of the VX-5R in other countries with full
RX with no holes in the bands.

If you're really interested, check out the YAESUVX5 mailing list at
OneList.com.

Good luck with your VX-5R,

---Vito

> Why not just buy a geniune 70cm radio?

I want to be able to send and receive with narrow (2.5kHz) deviation
appropriate to 12.5kHz channeling. The TX side of an amateur radio
70cm set can be probably be adjusted to that setting if the deviation
and limiting controls are documented and they have sufficient
adjustment range, but probably nothing much can economically be done
on the RX filtering side.

Thanks for your interest, and do you have any suggestions?

655. WWV time sync software

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-07 00:00:00 UTC
From: Brooke Clarke <brookeNOSPAM@pacific.net>
Message-ID: <370C283B.8C54297F@pacific.net>
Source record: 111430
Cross-posted to: rec.radio.shortwave,rec.radio.amateur.equipment,rec.radio.digital.misc

Hello Matt:

As you already know there are a number of sources for time sync signals.

I have found that the NRD-545 will receive the 100 Hz offset sub carrier
on WWV and my computer can read the S-meter over the RS-232 data link in
a fast loop. I have been able to plot the 1 minute data data frame, but
it needs more work to cleanly capture the digital data.

See NIST Special Publication 432 for details of the WWV sub carrier at:
http://www.bldrdoc.gov/timefreq/pubs/sp432/sp432.htm
See my time & frequency web page for more:
http://www.pacific.net/~brooke/timefreq.html

Although GPS is the most accurate, it does NOT have the bit for daylight
savings time.

73,

Brooke

665. Re: FNB4 repair

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-07 00:00:00 UTC
From: "Robert G. Schaffrath, N2JTX" <rschaffrath@acm.org>
Message-ID: <370B7E50.4AC5@acm.org>
Source record: 111478

I have a dud FNB-4 (genuine Yaesu) battery pack in my hand right now (never had a chance to get an insert for it - info appreciated). The white wire connects from the thermal sensor to the second "cup" contact on the bottom of the pack. This is the pad below the "N" in FNB-4. The only other negative contact that I see is a black wire running from the same cell that the thermal sensor is hooked up to to the little battery charger jack (outside connector).

Hope this answers your question.

73,
Robert, N2JTX

****
The backup battery is a lithium round battery with tabs on it to solder to ground and the circuit. You can order a new one from Kenwood. Be sure to connect the correct polarity to correct points in rig.

The battery is located at the top of the back of the rig and immediately visible at the surface. Remove the battery pack at the bottom of the rig, unscrew the 3 tineyscrews at edge of rig (from the backside) to take off the back cover. If needed - remove the larger flatheaded screws at the very bottom of the rig. Careful to note the position of the spring and button assembly of the PTT button when you remove the back cover. De-solder quickly - to not cause heat damage to other components.

This is actually very simple to do as this was the first thing I had to do when I got my rig and had no license yet and no hams to advise me. Once you are finished you will need to reset and put in the memory information again as the backup battery was the only way to keep the memories alive.

Well first, you have to be a "Certified Diode Remover", which
requires completion of a Microsoft Course Completion.

Then you have to join the "Diode Remover's Union," which requires a
25 year apprenticeship.

There is also additional training required by the EPA to ensure that
the diodes removed are not released into the air to deplete the ozone
layer.

Then you have to buy the expensive Kryptonite-powered diode removal
device. Normal laser equipment will result in shoddy work.

Sorry.. I just couldn't resist writing this!!!

I have the following books (all in excellent to new condition)
available:

Understanding Data Communications by Friend
The title says it all! $ 15

Understanding Communications Systems by Cannon
This one covers all sorts of communication systems -- not
just the data communications like the one above. $ 15

Modern Electronic Communications by Miller
Technician level (Associate degree)
Communications techniques, modulation, TV, antennas, wave propagation,
waveguides, fiber optics, noise,
2nd edition - 1983 - $ 15
3rd edition - 1988 - $ 18
4th edition - 1993 - $25

Intro to Digital Data Communications by Stein
Data formats, UARTs, RS-232, codes, telephone systems,
DTE/DCE interfaces, error detection, protocols, multiplexing,
packet switching, LANs
Technician level (Associate degree) $ 22

Digital Electronics by Uffenbeck - Technician Level text
Covers from number systems to shift registers to Programmable
devices to interfacing $ 25

Electricity - Principles and Applications by Fowler
Part of McGraw Hill's "Basic Skills in Electricity and Electronics"
group of texts. Mainly theory, in easy to understand
explanations. $ 20

Principles of Electronic Communications by Mandl
Includes modulation, amplifiers, noise, transmission lines,
antennas, etc. $ 18

Although not radio, I also have some collectible scout books
available:

Boy Scouts:
Exploring Handbook - 1958 - close to new condition $ 20

Handbook for Patrol Leaders - 1950 copyright - 1959 printing $ 18

Handbook for Scoutmasters - 1957 - 4th edition $ 18

Scout Field Book - 1948 copyright - 11th printing in 1956 $15

Girl Scout:
Brownie Scout Handbook - 1951 copyright - 1955 printing -
some wear - $ 15

Red Cross:
1986 American Red Cross "Expect the Unexpected" $ 2

If you would like more information about any book, please e-mail to
W8EK@fdt.net. All books are in good shape.

Prices do not include shipping from Florida.

Yep, Pretty common, Mine has done that at times. It's the white multipin
plug that plugs from the readout to the board if I remember right. Has a
dirty connection. When mine does that you can tap it real light and it
will come back on. Try unplugging and plugging it in a few times to
clean the contacts. MK

690. PA on a Motorola Radius GM-300

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-07 00:00:00 UTC
From: "Tracy L. Brooks" <rescue@wilkes.net>
Message-ID: <7egit1$c87$1@news3.infoave.net>
Source record: 111503

Greetings all,

Could anyone out there tell me how to hook up a PA to
a Motorola Radius GM-300, or if it is possible?

Here's what I would like to do:

Currently the radio has an external speaker. I would like
to have another radio output that feeds into the radio
input of a siren (the radio is in a fire truck). The external
speaker should work like normal and with a flip of the
switch on the siren, the radio audio should come out of the
siren (the external speaker should still work but not 100%
necessary).

I looked at batlabs and would think I would use pins 11
and 7 (RX audio and ground). Could I just use pin 11 since
both radio and siren are grounded to the frame? Also,
if it is possible, where might I obtain the little contacts that
go in the connector on the radio?

Thanks a bunch!

Tracy L. Brooks

691. Re: Question about TM-V7A

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-07 00:00:00 UTC
From: Keith Casey <kc7kc@bigfoot.com>
Message-ID: <370bcdd2.0@news.access1.net>
Source record: 111504

Hi Jimmy,

I have tried setting both sides of my V7A to two meters with AM receive and found that the right side would not go into AM mode. So mine seems to be the same as yours and I would not be suprised to find out this is a limitation. When I get a chance, I will try it on my other two V7A's. Maybe some other people could try theirs as well. Just press the button on the tuning knob for one second (MHz button.) If the decimal point on the frequency reading turns into an underscore, you're in AM receive mode. Repeat the operation to return to FM mode.

If you haven't tried remote controlling your TM-V7A yet, check out my web site for instructions.

http://www.access1.net/kc7kc

Good Luck

Keith Casey, KC7KC

Source record: 111507

Mike G. (no.spam@this.address) hath said:
: Hey Jimmy,
:
: Yeah, I just tried mine with the same results. My guess is they
: only put an AM detector on the one side and not the other.

I suppose so.. Its no huge deal, just wanted to make sure I was
not the only one with this problem before I performed a total
reset. Which now I'm not going to do since its happening to you
too..

: On another note... I've seen several folks complain about not
: being able to read the display very well when it's cold. If
: you adjust the contrast down when it's cold it looks normal,
: but then when it warms up, you have to adjust it back up or it
: will fade out on you. If Kenwood would have used a little temp
: compensation tied to the contrast they could have easily solved
: this annoying problem. (Sounds like a great MOD project for
: a ham with more time on their hands than me!)

Hhehe, luckly for me, I don't have that problem, I'm on the Gulf
Coast of Mississippi, the coldest day we had this year was 32 deg.
its been above 50 deg most of the time. However I do have problems
with the display in sunlight. No matter where I set the brightness
contrast, pos/neg side.. it doesn't matter. I think the biggest
mistake Kenwood made was to create that "cool blue" display. I wish
we could swap for an all amber background with black text. like
all of their other radios.

: Hard to find things wrong with the radio, have to pick at
: whatever I can! ;-)
: Mike (KD6PKJ)

I can find another fault... The radio doesn't have a wide enough
range, I could of got a Yaesu FT-8100 which would of atleast covered
the 800mHz range, And it seems Kenwood is the only manufacture who
has excluded any 800mHz in their radios since the TM-V7A and TH-79A.
I have a special need to rec. 800mHz public safety too... If it
wern't for the fact that I own 3 Motorola 800mHz trunking radios
and one Motorola 800mHz trunking mobile (Spectra) then I would of
got the Yaesu.

>other side.

That's not surprising. I don't have a TM-V7, but my Yaesu FT-51
has the same limitation. You can listen to VHF on both sides of
the radio, but only one side has an AM detector. There are other
limitations too, when listening to the "wrong" band, things like
larger tuning steps. Fundamentally, the UHF side of the radio
performs better on UHF than it does as a VHF receiver, and the
VHF side works better on VHF than UHF. The AM detector on only
one side is just another example.

You might actually be better off with a single-receiver radio like the
TM-G707 (or whatever the single-band twin of the TM-V7 is). Its single
receiver almost certainly *will* get AM, and it may have a "dual watch"
feature that scans between two frequencies. This is true of my FT-50,
a single-receive radio that can monitor two airband frequencies.

The other radio that might do what you want is the Icom IC-2710.
Icom advertises that it has *two* VHF receivers and two UHF ones,
so you can monitor VHF and UHF in any mix without performance compromise.
If both VHF receivers have AM detectors, you could receive two air
frequencies simultaneously.

Dave

Source record: 111544

Hello,

My mod is complete... first time using a solder iron or ever doing anything with electronic circuit boards...

The radio works like aways (great) but with open tx most everywhere it will recieve. I did it right the first time with a couple of deep breaths... no big deal.

If I could do it anyone could remove these surface mounted diodes...

Anyone have any idea how much power the 706MKII will transmit out of band on certain frequencies? I remember seeing a chart that a Ham had made up after testing his 706....

Thanks & 73!

720. Motorola Speaker Mic

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-07 00:00:00 UTC
From: Will White <wcw@asu.uswest.net>
Message-ID: <370B1736.9C07956D@asu.uswest.net>
Source record: 111547
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc,sci.electronics.misc,sci.electronics.equipment

I picked up a Motorola Speaker Mic, part no. NMN6128C, at a recent hamfest. I need the pin-out for this mic. As I received it, the mic has a "modular" type connector, that appears it would mate with its intended HT by sliding/snapping into place. There are five insulated wires, and one bare stranded wire (ground?). I want to use the mic with my Yaesu FT-50 HT. Any idea where I can find the correct pin-out information?

Motorola's web site is vast and unfriendly to retail customers. I searched in vain for an hour, and don't expect a reply to my email to them until maybe October (of 2003). Thanks for reading, and tres-thanks for replying.

What is your load? It's obvious you have meter errors. Are you using a dummy load? SWR ok on each band? The radio should do around 100-120 watts. So your 80m numbers pretty close. Also is your rf meter peak reading or average? If the power meter is average reading you should show voice peaks appx 1/3 to a maximum of 1/2 of your key down cw power. So if the radio does 100w cw key down, average meter voice peaks with normal audio drive would be appx 35 watts on voice peaks. I'd say offhand your radio is fine, your power meter/dummy load needs serious work. MK

More-n-likely those little grain of wheat jobs that draw about 25 ma.
You can get them at radio shack except the quality of those bulbs is not
the greatest. You may be able to find the same type of a different brand
that might last longer. If you use rat shack bulbs, you might add a
small dropping resister to add life to the bulb. MK

I've never seen any differences in 830's myself except for the gold
label on the later ones. On mine the 830 exactly matches the VFO-230.
Same color front panel, same lighter case color, same knob. So you can
use your vfo as a guide. MK

Would like to know if anybody out there has a National LF-10 Preselector for the HRO-500 that they would love to get rid of. I know there is one on Ebay, too rich for my blood. I know it is going to approach $250.00 (I paid that much for the radio in near perfect condition). If anyone has one that needs some TLC that they want to get rid of or one that is under $250.00 email me direct.

Thanks,

Gary bierbier@ix.netcom.com

>William Lee

The FT-1000D has a mystical following in the DX and contest arena and is highly regarded for its receiver, but after having owned it, I find its receiver to be average, as compaired to the MP 775 870 765 761 ect, In other words, it has nothing to brag about. The sub receiver is marginal, the fan is noisy, its a big heavy clunker, the power amp is rated at 50% duty, the main tuning knob tunes to quickly unless you spend another $50 bucks for the INRAD tuning upgrader, it has no dsp, not even an auto notch, and its way too expensive.

As far as the Omni series, I had a V model and it drifted about 1700hz, not acceptable for a modern day radio..I hope they dont have the same problem in the Omni 6.

My advise get a 870, you'll hear it all plus its less money, however if money is burning a hole in your pocket then get a 775, very quiet synthisizer, plus a robust final with FETs which can put out 200 all day and night, accurate frequency calibration, exellent receiver too.

I would go for the Corsair II, or maybe a Corsair I almost the same for
less money. The Corsair is a solid performer and proven track record, the
VFO is a bit drifty but again look at the money compaired to say a 1000D
ect, quite a savings.

Here is the word of wisdom, get an 870 over the 1000D. You should get to an audiologist as soon as possible. Get your tin can ear fixed. That radio is the best piece of junk in the HF marketplace to date. Totally useless in the RF environment that involves real antennas.
The 1000D is the ultimate receiver period end of story. You might try getting some real antennas to go with your big radios too.

I recently purchased an insert replacement pack for a Yaesu FNB-4 12 volt battery. In talking apart the set one of the wires from the negative pole of the battery pack came lose from the electronics of the battery pack. I attached to where I "thought" it went, but does not charge. Insides are more complex than expected as is made to charge via car charger, fast charger and directly power HT while charging.

If anyone has refilled this pack and has info - please forward - appreciate it.

Thank you,

Fred K

Matt -

I can do this now using a Heath GCW-1001 Most Accurate Clock and related software. However, you have to realize that, unless you are in Colorado, the propagation from WWV is not 100% 24 hours a day. This means there will be times that your radio clock is going to have to "wing it" and maintain the time using its own timebase which may or may not be terribly accurate.

Several years ago at my former employer I went through the process of installing an accurate timebase for my many Windows NT and Unix systems. I started with the Heath GCW-1001 WWV clock but gave up after about one year after the myriad of problems with 10MHz propagation and interference with the 10MHz signal from industrial devices (ie. computers, flourescent lights). I then replaced the WWV receiver with a Trimble Acutime II GPS based timing unit. Within 5 minutes of plugging it in, I had a highly accurate time signal which was based on continuous contact with the GPS satellites. GPS is definitely a better alternative if you need a standalone radio solution. The trimble is a bit pricey for a home environment but reasonable for a corporation.

One final solution which was not available to me at the time due to a firewall being in the way is the Network Time Protocol (NTP). There are many internet based time servers that you can use to continuously synchronize a computer system in the background. On my desktop here, I have a copy of WinSNTP from http://www.coetanian.com. It maintains time synchronization with various NTP servers on the net. I am currently maintaining synch with tycho.usno.navy.mil. There is also, tick.usno.navy.mil, tock.usno.navy.mil and a few others at usno.navy.mil plus MIT and other corporations and research centers.

73,
Robert, N2JTX

:I have to disagree with you. This is another area of ham radio (along with CW) that hasn't entered the 20th century.
Major retailers, sporting good stores like REI, computer retailers accept returns no questions asked as long as the equipment is not damaged.

:This restocking fee is a scam--15%--give me a break. As a new ham, I have deferred buying anymore gear due to this restocking fee. Your right I'll have to be more informed before a major purchase. BTW, do the hams working at these stores know all the bugs and idiosyncrasies of all the manufaturers units, not from what I read in the NGs.

:BTW, HRO did do an exchange for me without the restocking fee. I bought the K'wd TH-D7 HT with APRS. The ham that sold the radio didn't know jack about it, he'd just had an inservice the night before. Nor did he or I know you had to download APRS software, reconfigure your computer, yadayada.

Thank goodness the buyer beware attitude has died in most of the US.

I don't have the schemetic for that mic, however it is for
the Saber series radios. Listed below are the radio connector
pin outs that the mic mates to. You could also remove the back
of the mic and trace the wires and figure it out that way.
Watch out for differences in mic/spkr impedances between
the Yaesu and the Motorola product.
btw, I did this same thing once and "gutted" the Motorola
mic and "gutted" the mic that I wanted to use and just swapped
out the mic and spkr, retaining everything else including the mic
cord so that I didn't have to rewire a new cord, this retained the
original mic cord "look".
. This ensured that I had the same mic and spkr and
it worked great.
Per Motorola Manual # 68P81045C75-0;
pin 1= spkr
pin 2= spkr
pin 3= data

I must have struck a nerve here. My hearing is very good.

Get your tin can ear fixed. That radio is
>the best piece of junk in the HF marketplace to date. Totally useless in the
>RF environment that involves real antennas.

Based on these rash statements you have made, I have come to the conclusion
you dont know what you're talking about.

> The 1000D is the ultimate receiver period end of story. You might try
>getting some real antennas to go with your big radios too.

The ultimate receiver......come on, it shows your lack of experience. You
are one of those who have become hyped by the hype, for the mystical 1000
D.

For me to sit here and perpetuate this myth and maybe cause a number of
people to go out and spend $4200 bucks on a 10 year old design which will
not get them any more dx than a 870 surely would not be doing them any
favours.

FORSALE - MINT Icom 735 HF rig
---------------------------------------------------------------------

I have an absolutely mint condition (still has the
protectice plastic over the slide swithces!) Icom 735 HF rig that
I'd like to sell. The rig includes the optional 500-Hz
CW filter and the original hand mike with up/down controls. I bought
the rig as a "backup" and have never used it (other then to test it
out for about 1 hour). It's like new.

ICOM 735/cw filter/mic $575.

Check out http://www.swssec.com/agrelo.html to get one.
Have been told they are very good.
This unit supports 50-700MHz.
Frequency is determined by antenna length and spacing.
Scanner can be used.

Benji wrote in message ...

Allen, et al,

It is a troublesome grey area that the FCC really needs to address, though
with the numbers of illegal CB amps out there the point may be moot.

One may read the law to prohibit the sale of amps for CB use, thus eBay
may technically be pressured to not allow them to be advertised as such.

One may also read the law to say that a legal 10 meter amp may be sold to
anyone by anyone.

Here they have used the older interpretation and appear to have required
the seller to be a licensed Ham, though they have not required the buyer to
produce a valid Ham license. Hmmm.

I have just bought a used RCI-2950 from a fellow Ham, but we all know
that the majority of RCI-2950 and Uniden 2510 owners are not licensed
anything, just CB'ers who ignore the law ... and who now buy and operate
100 watt RCI-2970's and other rigs on 10 and 11 meters with impunity, not
to mention amps from 100-10,000 watts!

Is such activity illegal, sure! Is the purchase of a so-called 10 meter
amp
by an unlicensed person with the intent of running it illegally a crime,
sure ...
but try to prove intent! They can claim they bought it as a gift, an
incentive
to get licensed, or as a doorstop ... who is to prove otherwise?

Only catching someone in the act of operating illegally can the FCC
really
do anything.

Sorry for the bad news ... we've discussed requiring a Ham license to
buy or to gear designed for Ham-licensed operation before but there are
all sorts of problems with that as well. There is little honor left in
America
towards the law ... the reasons are obvious but that is as much a political
thing as a religious and sociological thing and not appropriate to this
venue.

I'm not familiar with that specific part number, but personally, I would
open it up and use my ohmmeter to determine the circuit configuration. I've
done this several times with other units and have successfully
"reverse-engineered" the circuit.

I have been to Japan 7 times with a total time in country of about 6 months. I have been to Akihabara many times and did see a few stores selling Amateur Radio equipment, but never found a bargain or anything different than what you could buy in the US. The are a couple of shops on the side streets that sell new and used equipment. I did make a purchase of a Kenwood TS-690SAT for around $1100 US dollars in one of these shops back in 96-97. Not a real bargain.

Remember that what you buy in Japan, you will have to pay duties (when re-entering the US) if the item is marked "Made in Japan". I had to pay an additional $80 US to get it in to the US.

Just my 2 cents.

Dave, check your swr. The 706 starts cutting back in power output as the swr increases. I am sure you know that,but the 706 is specially sensitive to any swr.Even a small amout of swr will cut back the power output considerably.
P.S I love my IC-706mk2....

I have a quick question about Motorola radios. It seems that I see alot of them for sale in this ng, but they always seem to be about the same price as normal ham ht's, or priced higher. What makes these Motorolas attractive to people? I dont' have much experience with them, but they seem to have less options than the newer ht's. Thanks.

<SNIP!>

An alternative, if you have access to SMT soldering equipment is to
use a SMT chip desoldering tip. These look like a two-pronged soldering
iron tip, and come in various sizes for the different chip sizes.
Metcal makes some excellent ones, but they're pricey, ~$450 for the
base/iron and ~$25 per tip.

The quick/cheap way to remove these is to simply use two soldering
irons! Heat both ends at once and when loose, slide the part to the
side until it's off of the pads. The down side to this is that it takes
a fair amount of coordination to control 2 irons on these tiny parts.
It does work rather well though...

Not a good idea. On Kenwoods sometimes there are thru holes under the
diode connection. Severing a trace you can see may or may not obtain the
desired results.

764. Re: Shop in Akihabara?

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-08 00:00:00 UTC
From: Vern <vpotter@synopsys.com>
Message-ID: <370CDEF6.231FB65B@synopsys.com>
Source record: 111385

Greetings Barry;

If this is your first trip to Japan, I'm sure you will find it safe, clean, and a real eye opener.

As you heard, Akihabara is the foremost place to go in Tokyo for ANYTHING electric, including all kinds of radio gear. There are numerous stores to choose from; most have a wide variety of goods, but a few will specialize. The prices tend to be effected by three major factors: proximity to the train stations, the store overhead, and (most of all) the current ($ vs Yen) exchange rate. Most of the major stores advertise "Duty Free" goods; but from my experience you have to buy something major to get any notable advantage from the "Duty Free" prices. In short, the best values are found when you look a couple blocks away from the main train stations. Don't be afraid of shopping at the bazaar like stores setup in the alleys; they are generally reputable and have more competitive pricing.

Be aware of what you need when you shop; most of the products in Akihabara are being marketed to the Japanese consumer, and may not be as practical for use in the US. First, pay attention to power requirements; Japan uses various line voltages from 100VAC to over 200VAC, both 50Hz and 60Hz, and different power plug conventions. In most cases, this makes their products more universal (user adjustable and/or auto sensing), but in some cases they are not. Second, be aware of frequency/band coverages and modes. For example, cell phones and transceivers in Japan do not (necessarily) conform to US FCC guidelines for band, mode, and power; although there is generally a notable overlap. Third, be aware of format differences, if applicable. For example, Japanese cell phone and television formats are notably different than in the US. In your case, if you are only looking for a shortwave receiver, some of these concerns may not matter; but if you start looking for a HF transceiver, then they may.

In my case, I found that (except for a few items) I could get the same or comparable equipment in the US for less (cost) than in Japan. This is counter intuitive, but is caused by the Japanese government's heavy subsidies to exported goods and almost as heavy tariffs on imported goods. So pay attention to (converted) price above all. The only items I tend to buy in Japan are those which I cannot get anywhere else. For example, some HT accessories are easier to come by there, and the price differential is small enough to still make them appealing.

Happy shopping.

There is a guy that used to (maybe he still does) make these things in Pleasanton, CA. I think he sold them in kit form. See if you can get in touch with Rich/KN6FW. Sorry I don't have an email address for him, but the call database still shows him in Pleasanton.

These are also available from marine electronics companies in off-the-shelf packages. If you can get hold of a magazine like Mobile Radio Technology you could probably find someone that makes them among the advertisers (I have seen them in there in the past).

767. NEW Icom IC-2800H with TFT color LCD display

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-08 00:00:00 UTC
From: Bo Chan <VE7WBC@qsl.net>
Message-ID: <370ce3cb@carrera.intergate.ca>
Source record: 111388
Cross-posted to: alt.ham-radio.mods,rec.radio.amateur,rec.radio.amateur.antenna,rec.radio.amateur.digital,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc

Dear all,

Please subscribe and discuss at Icom IC-2800 community!!

http://www.onelist.com/searchlist.cgi?searchval=icom-ic2800&language=0&maturity=0

New top-of-the-line dual bander adds video excitement to audio excellence. Advanced features and a unique, 3" (diagonal) TFT color LCD display await you. View GPS and APRSTM maps, catch SSTV or broadcast TV,... even watch digital camera and VHS images. Experiment! The high visibility screen accepts NTSC video input (PAL in the European model) via a simple connection port that accepts most standard camera plugs. A 6-pin data port makes the '2800H 9600bps data ready. ICOM's popular independent band controls are here, making it easy to work V/U, U/V, or cross band repeat. Also get: CTCSS encode/decode, simple band scope, fast scanning, 232 memory channels, air band reception, and much more. The control head is totally separate from the main unit, with a connection cable and independent mounting brackets included as standard equipment. Explore SEEING as well as hearing more of today's amateur activity.

Best Regards,
Bo

769. Icom 756 Problem - Icom Tech Support NO HELP

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-08 00:00:00 UTC
From: John Bogart <jbogart@westex.net>
Message-ID: <370CE801.CDB10937@westex.net>
Source record: 111390

I have an Icom 756 which has lost all XMIT on all bands. I talked with ICOM and was told that they know of a factory flaw that had no protection against static discharge that would knock out the XMIT IC. I was told that since the radio was OUT OF Warranty, they would not take care of the problem without charge. My feeling is, if there is a problem with the unit from the factory, they should repair and update to correct it happening again. Has anyone else experienced this?

Fred, you don't need to transmit out of band and you need an amp to increase power. you could get about 150 watts out of it which NO ONE would be able to tell and you WILL burn your finals.

Randy it is neither a uniden or a cobra relabel it was made by H H Scott inc. for sears
it is a real easy unit to convert if it is using the SM5104 chip
i have the conversion literature for this unit somewhere if you dont have any luck email me
and ill try to find it.
This unit has a great little transmitter in it however the reciever is a bit loose but
since
its an inexpensive unit it would be a nice unit to start out the hobby.
good luck.

Hi paul i dont think its a special battery you should be able to get one from the local radio shaft store
it will be located behind the front panel you may have to separate the display board a bit to get to it.
there are however a couple of models using special batterys and may be hard to find what i would do in that case is
buy a computer mem backup lithium battery and stick it inside the case somewhere also next time it would be easier to get to.
by the way this is one of the finest moble radios i have ever owned i have had one for many years.
hope ou enjoy yours as well as i like mine i use it for packet as well as phone.

They're legal to use in the commercial and public safety bands as
well as on the amateur bands. Ham rigs are not. Thus folks who want
a legal dual use radio are interested in them. There is also a mystique
about Motorola radios, that they're tougher and better built than ham rigs.
That's not always true, but perceptions aren't always shaped by truth.

Phillips PFX85 Hand portable Radios.

I have 6 HSE band (60 - 80Mhz approx) 99 channel hand held units.
they are all programmed with the individual TX RX matching frequencies on
the first 20 channels.

I only have four aerials & no batteries for these items, but they are all in
good working order.

Also I have a desk top charger that takes one PFX at a time.

Any better offers than 150UKP for the lot

793. 2kw 6 meter amp HB $$$$????

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-08 00:00:00 UTC
From: gudguyham@aol.com
Message-ID: <19990408180440.13273.00000041@ng155.aol.com>
Source record: 111414

Hi All, A local ham who has built a pretty nice 8877 homebrew self contained 6 meter amp that puts out 2kw wants to sell it. It has a nice Peter Dahl transformer and a strong 8877 tube. I saw it do 2kw on 50.150mhz into a dummy load. The workman ship is nice, it has a 3 minute timer to warm up the filament for 3 minutes before the HV goes on. Has a built in antenna change over relay and a very big blower to cool the tube. I was wondering if anybody out there could tell me what the value of such an amplifier is? I would appreciate any help and explainations you can offer. Please respond to direct e-mail........Many thanks....LP

794. FS: Pair (2) Motorol Tallkbout 280 SLK radios NiMH

MOST hams rigs have No Frontend and are terrible for taking into downtown environments. In otherwords, they are junk for that purpose. All I run is commercial gear and never have a problem with frontend overload, intermod, constant breakdowns, plus the resale value of commercial transeivers is alot higher then ham rigs. Its like comparing a Geo Metro to a fully loaded BMW. Both work but which one would you rather have?

796. For sale: FCC Frequency Database CD-ROM, 1998

Hi Gang
Would anyone have any information on the Adjustments on the main
board for a 706 MKII? The owners manual is very sparse on this.
If you have any information you would like to share you may send it to me via
E-mail at D.R.Abshire@att.net

Anyway my 706MKII is only putting out about 65-70 watts PEP on HF and 20-30
on 6 meters. 2 meters seems to be OK. Oh by the way I did check this into a
dummyload.......

> Yep i agree. If you dont want to add resistors,the best ones to get are
> from Icom. They are not too expensive and unlike the rat shack bulbs, they
> last for years.

I disagree guys. I ordered 10 bulbs from Icom, by the time I got them here
with the shipping ect it was about $30.00 thinking they would last, RIGHT.....

Well they last no longer than the rat shack bulbs. BUT they were green...and
so was I after about a month I had (2) go out. As far as adding resistors, Why?

Icom 735's have a voltage control on the side for display brightness. I average
about 2-4 bulbs every 2 months. I checked the voltage on the bulbs and its only
10- 101/2 volts. But this radio has did this for eight years now so I am getting
used to it.. ha ha....

By the way...Would anyone have any information on the Adjustments on the main
board for a 706 MKII? The owners manual is very sparse on this. If you have any
information you may send it to me via E-mail at mailto:D.R.Abshire@att.net
I DON'T KNOW WHY MY E-MAIL ADDRESS HAS THAT mailto: on it.....

Anyway my 706MKII is only putting out about 65-70 watts PEP on HF and 20-30 on 6 meters.
2 meters seems to be OK. Oh by the way I did check this into a dummyload.......

>> data. Spent about an hour on a cable to hook it up with
>> and then trying to figure out why I didn't have voltage.
>> We won't go into that.

His experience, I guess, doesn't include D.C. power cables! It also looks like his measuring device is more sensitve/inaccurate on some frequencies. Lets see, how many amps at 12vdc would it take to produce 500(!) watts cw? And remember to factor in(and lets be generous) 60% efficiency, = 160amps? So you can see, even at this distance, that something is wrong with the data presented.

I have a very nice, dare I say "like new" TS-180s, and measuring with an Autek WM-1, I see, at max, on 75m, 120w in cw.

Hi, Gary. How have you been?

I agree with your response, from a manufacturer's point of view and in the context of his total message, only part of which you quoted.

But, for the part you DID quote, the answer is "no". I've built a fair amount of home brew stuff over the last 40 years, and none has been (or has been required to be) sent to the FCC for type acceptance; that would be *a bit* against the spirit of the hobby (vs. the business the manufacurers are in)!

But again, reading his entire message (of which the last part was only a small part) your reply is right on. An individual ham building a transceiver for his own use must comply with the regs; but he is in a somewhat different legal position from the manufacturer who is selling rigs in mass (hopefully!) quantities.

You bet they are. I wish the makers of today's equipment could produce
manuals that are even half as good.

>The source of manuals for older Tek instruments is Deane Kidd, phone
>503-625-7363. He also has some replacement parts.
>
>Roy Lewallen, W7EL

Deane is really *the* expert on the 453A (great scope, I prefer it to a 465A).
I've restored two of them with his aid. I believe he bought the entire Tek parts
inventory for them when Tek quit supporting them. He has a lot of inventory
for other old Tek scopes too, but some parts for the tube type scopes are
unobtainium.

In many cases you can substitute something else, but in some cases you
can't. The only option is to get a junker for parts. When my 545B gave up
the ghost, I gave it to another ham to use as spare parts for his. Having
two or three carcasses on hand is very useful for keeping a very old scope
going. Switches and transformers are the sticking points. You can't get
replacement parts, or even reasonable substitutes, you have to salvage.

I wouldn't pay much for a 545. It is a huge old shop heater, and the sync
circuits aren't the best. For a few bucks more, you can find a 453A or
465 (the sync circuits in the 453A are the best). Those are better than a
mid-price brand new scope. You'd have to pay more than five times as
much to get a new scope that beats their capabilities. (I know, I have a
2465A too, and it cost me over five times as much as a 453A, but it is
only maybe twice as good as a 453A, and the improvements are probably
in areas that won't matter to you for servicing most amateur gear.)

I don't recomend it. SMD chip resistors and diodes are easy to remove cleanly.
A static hot air source like the Weller Pyropen Jr makes it a piece of cake. Doing
it with an iron can be a problem because you can only heat one end at a time.
You'll likely wind up lifting a trace (that's bad) if you use an iron. That's why some
people recomend crushing the diode or resistor. The trick here is to sever it
completely so that there is no connection at all remaining between its ends.
You can do that with a *sharp* pair of dikes, but you leave a mess if you ever
want to install another. Using the static hot air source, you can do it clean as
factory. Another alternative is to sever one of the traces with a sharp knife.
That way the part is still intact and you can bridge the trace cut with solder
if you later want to restore its function.

>them all. The 1000D is still here after a year and a half.

Takes me a little longer to evaluate things. The OMNI VI does not
drift, if that happened to you, it was a flaw. It comes with built
temp controlled oscillator, it is not an option like on many
other rigs.

I have owned the OMNI VI and the FT 1000 side by side. I won't
trash the 1000, it is probably preferable for most use on SSB,
but on CW the OMNI VI just plain does a better job of receiving
and of QSK. The transmitted note of the OMNI VI is variable,
some fellows don't like it, some do. I got mine where I want
it.

During the 160 meter contest, bring your FT 1000D over to
the house and sit it next to my OMNI VI and we can check them
out. That sometimes tells the tale. I didn't find a large
difference, but it was noticeable. The OMNI VI is still
here.

>Check out http://www.swssec.com/agrelo.html to get one.
>Have been told they are very good.

I've had a number of people tell me of problems with the units
and the company. Agrelo has turned production and sales over
to another company according to a blurb in QST. That may
address the problems people have complained about when
dealing directly with Agrelo.

The basic Roanoke doppler circuit that these units use (and most
other doppler DF units use too) is available in the Transmitter Hunting
book sold by ARRL. Several clubs and individuals have offered kits
from time to time. I built one from a kit produced by a local ham. It
works great. I use it with a scanner. I think it cost me about $120
including a nice metal case.

There's a more expensive approach, sold by Doppler Systems.
See ads in QST. I've seen one. It might be a little better than the
Roanoke systems, but not enough better to justify the difference
in expense.

A much cheaper approach is the double ducky differential time
of arrival system. Kits are available for about $20 from a number
of places, and they work quite well as handheld units. The doppler
units are better for use in a moving car, though. They let you
visually average out multipath effects.

still interesting. Why not ask Gary Fiber or

> 2. Anybody run the rig from 12 vdc? I know it has a built-in AC supply, but
> I'd like to have 12 vDc capability. No, I'm not planning on putting it in
> my car. Any experience with DC-to-AC inverters?

There's no need to use an inverter, the internal AC inverter psu
produces 12v DC which then connects internally to the rig with a
standard Molex DC connector. If you want to run on DC, just break
this connection and stuff your DC in there. I think that DC > AC
followed by AC > DC makes no sense and it will also create a lot of
unncessary inverter hash that you really don't need. Indeed the
765's own AC psu is already pretty noisy on the lower bands if your
antenna is too close by.

> 3. Someone told me to get the PBT mod. What is it? Where's the mod page?

The rig, reputedly, has the full dual passband tuning circuitry that
was used in the earlier 761 and is still found in the 781, but only
the single IF shift was brought to the front panel of the 765 because
of a patent dispute that Icom received from another manufacturer.

Sorry I can't direct you to the documented mod, but it shouldn't be
too hard to locate.

These and other questions will be well answered if you ask them in
the Icom mail list/reflector. Subscribe to this by sending an email
to majordomo@qsl.net with the words SUBSCRIBE ICOM in the body.

841. FS or TRADE: RS HTX-202 HT New in Box!!

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-08 00:00:00 UTC
From: rpemers@aol.com.alt.edu
Message-ID: <19990408105513.14815.00000049@ng-fy1.aol.com>
Source record: 111474

I have a brand new HTX-202 2 meter HT that I would like to sell or trade for a 25-30amp regulated power supply. I purchased two of these units when Radio Shack was closing them out. I thought my step son would take an interest but since he has not, I only need the one I've been using. The second unit has been in the original box and I only had it out to make sure it worked and that all accessories were there. It is missing the original manual, but I will download manual from RS website and include.

I will only consider a trade for a new or recently purchased 20-25 amp supply or a 30-35 amp supply in good or better condition. I will also sell the rig outright for $125 plus shipping.

If interested email me! Tnx

I have just been given two Motorola Maxtrax radios, but I don't have any information about them. They are obviously two channel units, but I don't know what band they operate in or what mode (trunked or conventional)

Both units have two model numbers on separate labels on them; HUD1745A2 and D43MJA73A5CK.

Motorola's web site was of little use.

Anybody know what these are?

843. Re: Yaesu 920 vs ICOM 756 for cw...

I'm also 99% Cw op and had the 756 for about a year. It was great on CW for chasing DX as well as casual CW Qso's. Dual watch worked great as well as the pass band tuning. I wasn't very impressed with the audio filtering. The only drawback I found was the lack of filter options. I sold it and bought a used Omni VI and never regretted it.

Phillips PFX85 Hand portable Radios.

I have 5 HSE band (60 - 80Mhz approx) 99 channel hand held units.
they are all programmed with the individual TX RX matching frequencies on
the first 20 channels.

I only have 3 aerials & no batteries for these items, but they are all in
good working order.

125UKP for the lot or 30UKP each (P&P not included)

Chris, tell Associated Radio that you want to return yours because you
can get it for 1,299.95 and see what they say... It would be worth a
try. YOU never know. I think the 1,299.95 is because it is prepaid so
they dont have to give VISA 3%... OK with me...

Actually, I intend to run this as my main rig at home. Lost interest in having a big shack. I was originally going to do the 706MK2G an hadn't really followed the FT100 that closely, but, someone I work with told me to take a look, When I saw the general coverage receive range, and built-in packet, that sold it for me. Also, someone else I work with is having a bear of a time making a Heil mic work with the 706MK2. Add to that a cheaper price, and I was sold.

Can't wait to get it. I just got the new call sign...was WB2FRX, now K2CJB...new call, new rig. Thinking about new antenna too...any thoughts? I have a TA33Jr now and a G5RV in an inverted-vee. Thinking about a vertical like R6000 or 7000.

> one (or both) to buy.

I'd check your manuals specs, but that setup sounds about the same as my 830. The 455 hz filters are a little tighter in my radio's case.Comparing a YG-455c with a 60 db bandwidth at +-425 hz to the YK-88c with a 60 db +- at 900 hz. I use the YG-455c alone. In the 830 I use it in, the VBT will let me narrow it further down to about 150 hz from 500 hz wide open. Plenty narrow for my fairly casual uses. Some might want both or use the 250 hz instead, but I don't need it. If it was me I'd get the YG-455 first and try that. I bet it will be good enough. I'm thinking of getting a TS-450 myself, so will have to do the same. MK

> to change out or am I smarter to let the tech do it?

Do it yourself. It's easy! Use an allen wrench to remove the front of
the unit. If I recall you will need to unsolder the battery or clip
its leads.

Can't recall the battery type.

Then--get a battery holder from your favorite parts store and insert the new
battery, solder the wires on the new battery holder wrap your new battery
widget with electrical tape and insert it into a little recess you will
see there.

Once you take the front of the rig off you'll see how easy the whole process
is.

876. Re: Should I choose a TH-79A(D) or IC-W32A? --Thanks--

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-09 00:00:00 UTC
From: eric_fre@hotmail.com
Message-ID: <7ejljpdtb1@nnrp1.dejanews.com>
Source record: 111333

I was going to buy a W32A about 3 years ago but couldn't get one at a good price so I got a TH-79. The W32, 79 ant FT-51 are the only true dual band radios. I used my 79 in Antartica on marine band for 2 years with the only problem being the display fading out. I think this is due to me getting IPA in it after cleaning the PCB mod! Radio is outstanding. I like the battery location because it is inside the radio and protected. It cant fall off the back. Problem is the radio is not weathe proof. However the W32 wasnt either back when I bought the 79. If you get an international one it had a dedicated 800MHz rx which is far superior to other radios and scanners. It has secondary VHF and UHF rx aswell so it will do dual in band RX aswell as the 300 MHz band. Out of band power is excellent and goes every where. It does full duplex and cross band repeat as well. In the end with all the packing I did I'm glad I went for the liter option of the 79. I took the diode out of the AA pack and useded NiMi so never had a battery problem. It also charged very nicely from the wind generators in the field. Dont even look at the new data thingy D7 or what ever it is its only a wide band tranceiver not a dual bander. I hate the way they market radios as dual banders just because they work in 2 bands its still only a single radio like I said the W32, 79 ant FT-51 really are duals and they work like 2 radios!

Cheers
Eric.

It's my understanding that you run a cable connecting the HCD214 to
the scanner's discriminator output jack (which you installed when you
made the mod). Then you plug the HCD214 into your computer's serial
port.

Someone please correct me if I'm wrong, as I am attempting this
project as well.

At this rate, I wonder what the price will grow to by Monday? Good
radio, I have one -- though with the 5 watt battery it is about 3x
bigger than my new VX-5R. It is about the most capable Yaesu HT,
though, in terms of ham band features.

:> on 145.80 - 146.0 MHz.
:
:We don't have to stand by and do nothing, do we?

If we do it will go away in 30 days.

:One idea is to create phasing distortion adequate to render
:the received signal unintelligible (bouncing our signals off their
:satellite would cause two signals to be received at the same
:time on the same frequency with different content). I suppose
:we could also find the control signal and jam it so they cannot
:turn the ridiculous thing on. Or could we find their most valued
:VHF frequency and bounce a mixing frequency off that same
:satellite so that the resultant frequency would jam their receivers?

Or, you could not.

:Let's get creative folks ... in addition to complaining ... it's more
:fun to speculate as to how to prevent it by being clever! :-)

There are people who would happily jam amatuer sattelites. You are
giving them ideas.

:Hmmm ... how low is that thing going to be flying? Perhaps
:a weather balloon and some C4? ;-)

Although it's not the best thing a commercial enterprise could do
it is providing publicity for amateur radio.

Unfortunatly the amateurs posting on the Swatch website are not the
best publicity.

The Omni 6 has the nastiest cw keying of any rig manufactured today. This is a well know fact and the newer + model is even worse. Most of them suffer from a slight chirp and there is no easy cure. The old Omni-C has the quietest receiver and best keying of all their products.

891. Yaesu 920 vs ICOM 756 for cw...

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-09 00:00:00 UTC
From: Joe B <nospma@thanks.com>
Message-ID: <370E198C.E754F396@thanks.com>
Source record: 111348
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment

I've FINALLY narrowed my choices down to these two radios -

What I need: All I work is cw (no SSB at all) - so I would like a radio which was designed with some nice cw features in mind. 99% of my operating is chasing dx (cw) so a low noise floor and a great receiver are very important.

I would like some opinions on these two radios from people who own and use either radio for cw operation.

Please - no "I don't own the rig, but I HEARD" comments - or recommendations for other rigs ok? I've done some research and these are my choices - thanks for understanding...

Thanks in advance -

JB

I have been using an Ft-100 for about two weeks and am currently writing a review for a ham magazine. Aside from one quirk that I am working with Yaesu to see if it is specific to this unit the rig has done well. Currently it is mounted mobile in conjunction with the matching ATAS-100 screwdriver antenna and performing extremely well. I have had good reports from many US and DX stations on audio and signal strength and even worked the RS-12 Russian satellite with it from my driveway. The rig/antenna control is very good and the display works well in bright light. These are first impressions and by no means a lab test. You can also find a first impressions article of the FT-100 on the ARRL members only site and...WM7D has started a www page of FT-100 resources at <http://www.wm7d.net/hamradio/ft100/>

Hello all, I know this came up before, but I lost my note to myself on the subject. Can anyone out there give me the name/address/url for suppliers of the oddball 4-conductor speaker-mic plugs that mate with the Yaesu FT-50R handheld? I want to run packet through my FT-50R and don't want to sacrifice a speaker-mic by chopping its head off. Thanks in advance de N2PRC.

Hello to the group,
I have a nice 6 meter rig for sale. It is an Icom IC-551d and it comes with the matching power supply IC-PS20. The rig does AM,CW, SSB, and puts out a full 80 watts and is very clean. The rig does not have the FM board in it. It comes with the Icom optional low noise hand mic all gear is a 9 out of a scale of 10 and ready for delivery. The rig also comes with the separate standard power cord, manuals (radio & P/S), no original carton though (sorry)!

The price is $450. firm , buyer pays shipping.

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-09 00:00:00 UTC
From: hasan schiers <schiers@netins.net>
Message-ID: <7ela6ukvo1@ins8.netins.net>
Source record: 111362

I'm very happy with mine. I have not used it on 160, but have on all other bands to include warc and 10m and it has worked beautifully. 500w output is pretty typical, more in some situations.

My only complaint is that you need to periodically take the case off and clean the antenna relay contacts.

I've had it for a couple years and it gets used quite a lot. I've had large tube amps in the past and found that this one puts out adequate power for my needs and has been very reliable.

It's also a breeze to use and appears to be reasonably well protected.

They aren't cheap, but if all you need is 500w and you want convenience and reliability, as well as a small footprint amp that is dead quiet, then go for it.

906. Re: Yaesu 920 vs ICOM 756 for cw...

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-09 00:00:00 UTC
From: John <mstr-jl@swbell.net>
Message-ID: <X_pP2.3314$7_6.30981@typhoon01.swbell.net>
Source record: 111363
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment

I've had both, and I use cw a lot too.

Strictly between the two radios (too bad I can't discuss my 1000MP), I'd go for with 756. The twin passband tuning is very nice and the receiver is excellent. The scope is kinda "cool" too, although somewhat insensitive.

I had a Yaesu 920 for about three months and liked it, but had to get rid of it due to close in stations pumping the AGC to death. The Icom doesn't seem to have that problem. Even in crowded conditions, it's great. Anyone else with a 920 have that problem?

I didn't have both radios at the same time, so I can't give you a "side by side" test result, but as far as receivers, I feel the 756 has the edge.

Anyway, good luck - they're both nice radios.

John

> An analog...or voice...scanner can hear digital "squaking". But you won't be able to hear what's being said. US Federal Agencies also transmit a "quiet" signal that can be heard only as a sudden burst of white noise. Eventually, the market will sell a digital-reception scanner. But it's likely to be closely regulated, if legal at all.

From: mjlinden@mcs.net
Message-ID: <7enuhj$8vh$1@Nntp1.mcs.net>
Source record: 111228

I'm thinking about getting a new HT in a few months. The I'd like something a little more modern than the ICOM IC-2AT that I've had for some time. I've narrowed my search down to the following three:ADI AT-600, Kenwood TH-G71A, Icom IC-W32A.

I'd sure appreciate any input that current owners have on these units, both pro's and con's.

Thanks, Michael J. Linden, N9BDF

922. Re: Heathkit IO-4560 Schematic Needed

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-10 00:00:00 UTC
From: datapro1626@my-dejanews.com
Message-ID: <7eo2ua$t92$1@nnrp1.dejanews.com>
Source record: 111229

My thanks to the few people that offered help on the IO-4560 schematic. It appears that the IO-4540 and IO-4560 are very similar. The IO-4540 is the dual trace version of the IO-4560. If you were to look at the insides of each of these scopes, you would never guess they were Heathkit. These must have been their "rock-bottom" price scopes. There is a ton of point-to-point wiring on really cheap insulated "stand-offs". The only PC board is a single sided laminate (not even glass) PC board. You remember, the kind that the foil would peel off when you touched it with a soldering iron.... Anyway, in frustration, I called Heathkit directly and to my amazement.... the manual is still available!

It's a photo-copy and not an original, but HEY, I don't care. So my thanks to those that tried to help, and my advice to them would be; If you see either of the IO-4540's or IO-4560's in a garage sale, or hamest.... RUN AWAY!!!!!

Thanks and Regards
Don Peterson

923. Replacing large caps in audio amplifier power supply

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-10 00:00:00 UTC
From: voicebox_voicebox@dnai.com
Message-ID: <voicebox_voicebox-1004991100130001@dnai-207-181-238-93.dialup.dnai.com>
Source record: 111230
Cross-posted to: sci.electronics.repair,sci.electronics.design,sci.electronics.misc,rec.radio.amateur.equipment

I have ordered new replacement alum. electrolytic caps for my audio amplifier.

The original ones are 22,000 mF @ 75v. The new ones are 54,000 mF @ 75v.

The power suppy that these caps are part of is a simple bridge rectifier
connected to a large iron transformer. The rail voltage is approximately
68 volts.

If I use these new caps which are more than twice the capacity of the old
ones, will this result in a higher rail voltage, and therby result in
inappropriate voltages for the rest of the amplifier circuit?

In short, do I have anything to worry about if I use these large caps?

Sorry about my modified return address, but I hate getting spammed.
My corect return address is provided below if you choose to e-mail me.

Thanks,
Dave

One thing I can think of is higher power dissipation in the rectifiers. Less output ripple will result with higher capacitance. This means a narrower "conduction angle" for the rectifiers, which implies a higher peak current through the diodes. Since power dissipation is a non-linear function of current (something like I^2*R, although diodes aren't linear resistors), a higher current for a proportionally shorter time can still mean higher power dissipation.

So you might want to check the temperature of your bridge rectifier.

As to voltage, I don't think that is a concern. The peak output voltage shouldn't be much different from before. Of course, as I said, the output ripple will be less, which is generally good for the circuitry being powered, but not for the diodes in the bridge.

Todd

I'm looking for an S-100 bus modem. Yes, honest, S-100 bus, 300 baud modem.
I want to add it to an S-100 bus system I have and add one to my display
wall at work where I have a number of S-100 items. Any S-100 bus modem you
may have in that box of wires in the shack. I'll buy it from ya. I'd also
be interested in an acoustic modem (coupler) if you have one of those.
Please reply to me directly at chipsndips@snet.net.
Thanks.

Alan

I was told that other Dealers were complaining . Basically when a new radio comes out the Distributers and Dealers try to get as much as they can from the guys who have to have the radio at any cost. Once those guys are satisfied then the Dealers will have to lower the price to sell to the rest of the Ham population.

Ed;

The value of most keys will depend on model, date, and S/N info as well
as condition.

Two excellent sources are Tom Perera, W1TP; and Tom French, W1IMQ.

For the first, try:

http://www.w1tp.com

For the latter, try:

http://home.fiam.net/tfrench/ARTIFAX.htm

Wander around in those web sites a bit and follow the various links to
other telegraphy and/or McElroy related sites. FYI, Tom French wrote a
comprehensive book on McElroy. It is available through Artifax Books.

Just so I will have tried - "Mac Keys aren't really worth very much!
I'll give you $25 for it, if you pay the shipping!" ;^}

941. Help: ICOM IC-R71A has oscillator problem

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-10 00:00:00 UTC
From: David Drumheller Drumheller <dmd.ka3qbq@worldnet.att.net>
Message-ID: <7eoeqbntc1@bgtnsc03.worldnet.att.net>
Source record: 111248

I own an Icom IC-R71A shortwave receiver that is about twelve years old. Today I was trying to listen to some 20m amateur transmissions and noticed that the reception frequency drifted, rendering the receiver useless for monitoring SSB transmissions. The drift is intermittent, and is not reflected on the digital display. If I tune a voice transmission, everything is fine for a few seconds and then the voice "wobbles."

Has anyone had this problem, too. If so, what's the fix. Can I deal with it myself, or do I have to get factory service.

Please reply to me at drumheller@nrl.navy.mil.

948. JMP K on TNC2 (MFJ-1274) missing header

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-10 00:00:00 UTC
From: Ralph Hyre <packeter@csweb.com>
Message-ID: <7eolud$bh8$1@nnrp1.dejanews.com>
Source record: 111255

It's been 12 years since I bought my TNC-2 clone. Now I'm trying to
wire it up to a Yaesu FT-530. Have the MFJ 5024 cable, but it still seems
like I need to do something to the TNC to get the PTT function working.

The TNC manual mentions a JMP K that can be installed, but I used to interface
this with a Alinco ALM203T by using an R/C network.

There is no header at location JMP K to slide jumper on to.
I see two solder pads with the appropriate spacing at this location on the
board:

```
| |J2 (5-pin DIN)
/\/\+ [oo] JMP K?
| o (other solder pads)
| o + + <---jmp 7
(resistor)
```

I'm not excited about the prospect of doing surgery on this ancient beast,
since the FT-530 is a temporary measure until I hook up a dedicated data
radio.

Any suggestions? I have the TC55257BPL-10 chip on board, is that the 32M
RAM I need to run the TNC2 1.1.7 (KISS) firmware?

A friend is in need of the matching probe for his
HP 4815A RF Vector Impedence Meter.

I told him I'd ask around on the Internet.

Thanks! & 73,

958. ICOM 746 - dumb question regarding amp tune-up?

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-10 00:00:00 UTC
From: Larry Gauthier <larryg@ismi.net>
Message-ID: <3710033a@news.ismi.net>
Source record: 111265

OK - So what's obvious about using this new rig of mine that I am missing? I'm almost embarassed to ask the following:

I have a new IC-746, and it seems to be working fine and everything's peachy. I also have a Heath SB-230 that I am using with it.

My question: when I flip the amp on and want to ensure that it is properly tuned, what is the correct procedure for getting the rig to "key" and flip the amp to transmit? Unlike older rigs that had "tune" buttons, the 746 does not have this feature. The tune button on the 746 engages the antenna tuner and performs a very brief auto-tune - not suitable for tuning the amp.

Let me describe how I'm doing it now... Say I'm on 15 meters in USB, and hear a weak station that I want to work - so I kick on the amp. BUT - in order to tune/dip the finals in the amp, I have to change to CW mode (which is the equivalent of LSB... changing the frequency and perhaps interfering with another QSO - so I may have to QSK to avoid QRM'ing someone). I reduce the output control on the 746 (I never tune up at full output), close the brass key to cause a CW transmision (which is the ONLY reason I have a key plugged in - otherwise I use paddles for CW), tune/dip the amp, open the brass key, change the mode back to USB, QSk back to the original frequency, return the output pot to full power, and attempt to work the weak signal. ((If the band's really crowded I may end up flipping to/from a dummy load to tune-up))

Am I overlooking something here? Is there an easy tune-up somewhere? I even <gasp> read the manual and it offered no suggestions... other than buying Icom's auto-tuning solid-state mega-backs amplifier!

lithium batteries are usually good for 10-15 years, depending on current drain. regardless of the chemistry, the existing battery will tell you what the voltage is. any lithium 9V battery will run you abt $7 to $10 per. for an EverReady alkaline energizer, the cost is about $2 per and will last about 9 months to a year.

it's your call.

A friend of mine purchased the Uniden frs 1400 HT's. Apparently the 1600 is the same thing with PL tones. We are going to be using them at Dayton this year.

The question is: does anyone know the mod for activating the PL tones? Is it an additional chip -- programming -- or jumper/diode placement?

One suggestion, you don't need to use the straight key, select RTTY
instead of CW and simply push the "Transmit" button under the main power
switch.

>If I use these new caps which are more than twice the capacity of the old
>ones, will this result in a higher rail voltage, and therby result in
>inappropriate voltages for the rest of the amplifier circuit?
>
No, you won't get a significantly higher output voltage. With a very
small cap value, you get 2/[pi] times the peak value of the transformer
output voltage. With a huge cap, you get the peak voltage. The
changeover from near the low value to near the high value occurs over a
rather narrow range of cap values which are all too small to give a
sufficiently ripple-free output voltage for an audio amplifier (or most
other things).

>In short, do I have anything to worry about if I use these large caps?

Not in your case. There are situations where doubling the cap value
could cause problems with the rectifier (excessive repetitive peak
forward current) but in your case, that is very unlikely.

968. Re: Tektronix RM-45A scope query

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-10 00:00:00 UTC
From: Xjshillw6ivw@earthlink.net
Message-ID: <370ec757.15980374@news.earthlink.net>
Source record: 111309
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.boatanchors

I have a number of Tektronix 530-540 series scopes (wish I had less), and notice they are starting to malfunction. At a minimum, I would take off the side and bottom covers, set it right side up, and turn it on, carefully watching the side opposite from the plug-in. There's a time delay device, and wait until it operates, which applies B+ . Be ready to turn it off quickly if there problems (sounds, smells, etc). You can then do a little preliminary trouble shooting and see where the problem area is, i.e. where is the smoke coming from. If it is underneath, you are ready to tip it over and check it fairly quickly. Have the work bench clean, so you can put it on it's side without damage. I reread your post, and notice you are going to check it at the store. Taking off the side covers is still a good idea, particularly if you plan to make a lowball offer if there are problems.

If no sounds or smells, and no trace, look at the little neon bulbs giving rough trace position. There is a good chance the trace is off the face. If the trace is a point, avoid a bright point (turn intensity down) to avoid burning the CRT, which makes the phospor black.

If you have a choice of a number of manuals, notice a serial number is listed on the front page. Pick a manual with a serial number equal to or a little higher than your scope serial number.

I think a bad CRT is the least of your problems, and would not worry much about it initially. When trouble shooting, checking power supply voltages at the test points is a good start.

969. TH-22AT vs TH-28A

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-10 00:00:00 UTC
From: Bill and Meredith Frost <frostys@mdo.net>
Message-ID: <370ECD6F.1F4B97BD@mdo.net>
Source record: 111310

Anyone have an opinion on which of these would be better for a
beginner? I want something 70% for listening to railroad, etc on my
commute, 25% for repeater work, 5% for simplex on campouts and hikes..
The local club says we get a lot of pager intermod in my immediate area,
so that's a concern as well for RX/TX.

Or should I be looking at something completely different?

BTW does anyone know if the TH-22AT can be modified to RX the air band?
I haven't found any from searches of mod files and DejaNews, and I'd
like to know one way or the other.

Thanks,

Bill

From: Craig Schafer <schafers@ghg.net>
Message-ID: <370f557e.0@news.ghgcorp.com>
Source record: 111320

I read recently about a mod which can be made to the Icom IC-T7A dual band HT by holding down the Moni and Band buttons for 5 seconds during power-up. The article did not say WHAT it did.

What does this mod do?

Can it be 'undone' or is it somehow permanent?

Thanks,

Craig, KD5AOM

994. NEWBIE COMPUTER RFI QUESTION

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-11 00:00:00 UTC
From: Jim Long <longj@erols.com>
Message-ID: <37116409.1ABEEB9A@erols.com>
Source record: 111085
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

Hi folks,

I am having some computer RFI problems and am hoping for some help from the group. For the sake of disclosure, I AM NEW AT THIS! I am studying for a tech-plus ticket,
so my correspondence may not meet your technical expectations. Please bear with me.

I had been experiencing tremendous RFI when operating my computer and my ICOM
IC-746 at the same time. The RFI had been the worst on 160, 80,40 and 30m,
but was present on all bands. To aleviate the problem, I've run two 8' ground rods, located seperately, one for the antenna and one for the radio and other shack equipment. #4 ground wire runs from one of the rods and is clamped to a 1/2" piece of copper pipe. I run a chasis ground from my 746 to this pipe. I initially ran a chasis ground from my computer to this pipe but found that created slightly more interference (ground loop?).

This has eliminated 75% of the problem. The noise practically nonexistant on 10m and above, vastly improved on 40m, but still quite bothersome on 160m and 80m

My concern is that the computer RFI is travelling up the shield of the coax and back
down the center conductor. When the radio is not connected to an antenna there appears not to be any RFI problems, indicating to me that the radio's shielding is more than adequate.

Both computer and rig are plugged into SEPERATE BX circuits with self grounding receptacles. My tranceiver is connected to a half-wave dipole

with RG8-M (92% shielding) coax. The antenna is not yet grounded(my ligtning arrester just arrived today). The ICOM is grounded to the main

cold water pipe at basement level with #8 gauge copper mesh.

HERE IS MY QUESTION:

Will a line isolator such as a Radio Works T-4G eliminate this problem completely?

Thanks for all advice.

Jim

Doesn't make sense. The top section of the A-99 is 1/4 wave long (unloaded) on 10M while a firestick is shorter and top loaded. How could a loaded antenna be more efficient than a full size 1/4 wave radiator on 10M?

I don't believe that you will completely remove the RFI from your station.
ALL computer generate a certain amount of RF. This is accepted by the FCC
in their test labs. One way to REDUCE RFI is to purchase Type "B" computer
equipment, (motherboard, power supply/cabinet, drives, etc.) and install it.
The normal home use computer equpment does not have to meet the min.
requirement for an office. You may find more info in about any computer
magazine. Hope this helped a little. Also, remember, RF can't be grounded!

1013. Firestik Top Section For A-99

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-11 00:00:00 UTC
From: Tony Heatwole <heatwole@shell.clark.net>
Message-ID: <7eqma9$9du$8@callisto.clark.net>
Source record: 111138

Hello. I have heard of some people adding a Firestik top section to the top of the Solarcon A-99 (replacing the current top section). I've heard that many people claim that this has dramatically improved the performance of the antenna. I'm just wondering if any one knows WHY exactly the section helps, and where I might be able to get one. Or if any one reading this has one for sale, please let me know and we'll work out a deal. Any and all help is appreciated. Thanks a lot for reading and thanks in advance.

1017. Tribander Or Monoband Beams?

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-11 00:00:00 UTC
From: Tony Heatwole <heatwole@shell.clark.net>
Message-ID: <7eqo3q$9du$20@callisto.clark.net>
Source record: 111142

Hello. I have a question about which set-up you think would be the best one for everyday overall well performance. A 2 element beam for 40m, a 5 element beam for 20m, a 5 element beam for 15m, and a 5 element beam for 10m. Or, an X9 tribander beam with the 40m add-on kit. Now I know that all of the monobanders are better then the tribander, but are they better by a large enough margin for it to be worth it for me to get all of those monobanders rather then just a tribander? Any and all help is appreciated.

Chuck Garrett <ac5sm@home.com> writes:
>Yes. I have been told by Tandy that the parts are back ordered. I will talk to
>Gerald at service center Monday about bypassing the FET .

Apparently the FET preamp gain compensates for losses in the helical filters.
If you bypass the preamp, you migth also need to bypass the filters to
keep the same receive sensitivity.

On the other hand, if you have a good gain antenna but you're using the amp
with a handheld and getting intermod, you might want to bypass the FET
and leave the filters in place. The extra gain of the antenna will
compensate for the loss in the filters so you don't need the preamp.

hi,
kenwood fs.733a good condition with separation kit missing box.with manual..
also kenwood 731dual band with encode/decode clean & good working condition..
anyone interested let me know...thanks..

1031. Uniden FRS 1400/1600

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-11 00:00:00 UTC
From: Tony Giroux <agiroux@cvn.net>
Message-ID: <3710E782.AE76FE7A@cvn.net>
Source record: 111156

A friend of mine bought a pair of Uniden FRS1400 HT's. We found that htey are the same as the FRS 1600 series, but do not have the PL Tones.

Does anyone know of a mod to enable the tones? Is there another chip required - some form of programming -- a diode or jumper placement?

Any help appreciated.

Tony -- KF3BX

No, the trurn-on inrush is dependent only on the circuit resistance and
inductance. The cap value is irrelevant. The *steady-state* peak current
does depend on the cap value.

Nice rig. I used to run one. It is an All mode General coverage solid state HF base rig. All the bells and wistles you could get on a rig 10 or so years ago. 100 watts except 40 on AM and FM if I remember correclty. Had space in the back to insert modules for 6and2 meters and 440 mhz. Nice setup if you had all three modules. I only had 2 meters and 440 but I loved it. The only reason I sold it is I'm not a serious enough ham to keep that much invested in a toy.

I don't get it. Why would you purchase a 756 over a 746? Reading the specs as supplied by Icom, the recievers have the same sensitivity and selectivity. They are probably the same recieve section in each. The 746 offers MORE filter options, 2 meter all mode 100 watt capability, slightly better freq stability, smaller package, and is priced a few hundred dollars less. What am I missing?

You are essentially correct in assumptions, about this (beefed-up / 2X+) filter Cap configuration, in that if there is going to be any type concern at all for consequential (adverse) impact on the origanal circuit components, or their future electrical performance...? It would be related only to a somewhat higher in-rush current through the PS rectifier & primary AC line fuses (for a few more cycles of high AC in-rush current), which would only occur for about fraction of a second, when ever the amplifier is first powerd-up...

Once the (~2X+) capacity of the new filter-cap is brought up to (circuit working) rail-voltage levels, all other amplifier circuit performance will be essentially the same as it was before, since the amplifier's (dynamic / operational) average power requirements, sould be the same? As John Woodgate already pointed out in his reply, you may see a slight improvement in the PS ripple spec., but not much else..... Therefore, my two-cent bet would be on the very slight posibility of a blown AC primary fuse.... that is, if there were any problems at all.?

If you do pop a fuse or two, you could either slightly increase it's amp rating, or try putting a low value MOV (glow-bar varistor) in series with the AC input line, to help hold down the maximum in-rush peak currents, to something the SB-Fuse can live with (over time)....! The diodes used in the PS, won't likely have any problem over the few extra cycles needed to get the new PS filter Cap charged-up & running.

The only dumb questions in life, are the ones we never ask...

The area under the curve representing the power-on inrush current will
increase with larger capacitors, obviously. That's probably what he
meant by "the inrush current will be higher." Whether that is a problem
or not, depends on the rectifier ratings.

What you a re missing is the panadapter band scope, dual-watch recieve,
and dsp enabled recieve (and transmit). The reciever is quite, quite good,
and works am as well as ssb quite nicely.

Message-ID: <9VbQ2.139$b%1.146946@ralph.vnet.net>
Source record: 111175

10baseT network shouldn't have much or any noise, due to it's twisted pair configuration. THeory is that any noise affects both wires in each pair eq ually, but the wires are 180deg out of phase, so when the signals merge the noise is cancelled out, leaving only the clean signal.

1057. KNWD TRIO 820 help

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-11 00:00:00 UTC
From: Chuck Garrett <ac5sm@home.com>
Message-ID: <37100E8A.E6057BA5@home.com>
Source record: 111182

I need a copy of the manual for a Kenwood TRIO TS-820-S. My Ham friend has recently acquired same from EBAY auction with no manual. I would like to surprise him with a manual or copy. I'm sure it would make his day!
Help if you can, no problem to send $ to cover the trouble.

Best Regards,

Chuck AC5SM

1058. Micro antenna for FT-50?

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-11 00:00:00 UTC
From: valerie65@my-dejanews.com
Message-ID: <7eouo0$i4p$1@nnrp1.dejanews.com>
Source record: 111183

I'd like to occasionally use my FT-50RD as only a scanner, and am looking for a SHORT replacement antenna, perhaps with a BNC mount (yes, I have the adaptor). Can anyone recommend something about 3" long or so? Longer antennas almost defeat the purpose of the belt clip....

Thanks,
Valerie

>Alternatively, can someone describe how to operate, in general, the
>tuning portion of the unit? Thanks.
>73 Rick N6CY
>

1) Set band switch to desired band.
2) Set Both Resistive and Reactive tuning to 5
3) Set Resistive and Reactive range switches to 0-10
4) Set VSWR Set Control to Fully Counterclockwise
5) Meter switches to VSWR Read
6) Energize transmitter apply low power to the MN-2700.
7) Adjust transmitter plate tuning to resonance, adjust loading on
transmitter to minimum (if these are settable on your transmitter)
8) VSWR meter should read upscale. Vary the Resistive Tuning until
you see a dip. If there's not enough tuning range to see a dip,
switch the Resistive switches in until you can do the dip.
9) Turn the Reactive tuning clockwise a bit.
10) Readjust Resistive Tuning for a dip again. If this dip is
downscale from the first dip, you're going in the right direction. If
not, turn the Reactive tuning counterclockwise and dip the Resistive
tuning until you get the lowest dip.
11) Keep doing steps 8 thru 10 till you get the lowest possible dip.
12) After the tuning process, you can add on the linear amp and start
transmitting.

The MN-2700 manual, as well as almost all Drake operations and service
manuals can be printed out in their original form from the CD-ROM sold
by HAMManuals. Check out their web site www.hammanuals.com.

I think you may need to worry about different fuses....wont there be a surge of current when they are first turned on because they need to charge. In books that ive read it says to use a slow blow fuse because at the beginging a regular fuse will blow

im not sure though

Hello All,

This is Mike, KQ6MU.
A friend of mine, and I, are trying to build
a 2m repeater. We got a Motorola Micor VHF Hi
Base Station. It was tuned to 155 MHz. We need some
help on duplexing this, tunning it to the 2m band, and
other things that will be needed to "Mod" this to a
repeater. If anyone can give us info on this, we would
greatly appreciate that. Anything is welcome.
E-mail me with info please.
Thanks & 73,

Mike Green KQ6MU

1066. Timewave Announces DSP upgrade for PK-900

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-11 00:00:00 UTC
From: jdouglas@timewave.com
Message-ID: <7ep3joimr1@news.minn.net>
Source record: 111191

NEW! PK-900/DSP Upgrade for the PK-900

Timewave's Powerful DSP Technology improves the PK-900.

Now the finest analog data controller ever built can be even better. The PK-900/DSP daughter board brings a whole new level of performance to the PK-900. Weak signals and crowed bands won't stop your QSO. Noise and QRM are rejected by the DSP filter for better copy and fewer errors.

The PK-900/DSP upgrade kit provides more and better HF filtration. 39 Optimum DSP filters are selected automatically as you operate. The upgrade runs with all of your present software, or you can upgrade to the latest Y2K ready Windows 95/98/NT software PK TERM '99 and have control of three new CW DSP filters, 50,100 and 200 Hz.

The upgrade is user installable. Price and specifications are available at http://www.timewave.com

For questions and availability information, contact sales@timewave.com

Ebay is just like here. It's not 100% perfect. That would be foolish to think it was. As for a false sense of security. (?) I don't know about that, one has to make there own educated decision on who they buy from. It's up to one's own judgement. Through Ebay, you at least have a feedback system to give you another tool in your decision making process. I personally shy away from bidders and sellers with "0" feedbacks or have "mask" attached to them. But that's me. Buying here in the NG's, you pretty much have no way to know who you are dealing with !

As the saying goes, Buyers Beware!

Just my 2 cents.

-ERIC

Philips PFX85 Hand portable Radios.

I have 5 HSE band (60 - 80Mhz approx) 99 channel hand held units.
they are all programmed with the individual TX RX matching frequencies on
the first 20 channels.

I only have 3 aerials & no batteries for these items, but they are all in
good working order.

125UKP for the lot or 30UKP each (P&P not included)

I looked up kenwood21 on ebay and he has 2 positive feedbacks that could be bogus. I have had better luck with ebay as of late than I have dealing with fellow hams either found selling gear here or on packet radio. Seems everyone thinks his gear is either New or #9 condition. What ever happened to 1-8? Everytime you buy something sight unseen I guess you are taking a chance, but as of late I have had 3 radios delivered to me with major flaws undescribed etc.....

It is very unlikely to create any serious problems. Do pay very careful attention to the lead dress as the nonlinear currents in the power supply of class AB can and do influence the distortion. You really need a distortion analyser to do it right.

Yep and use a dummy load. Also right down the plate and load settings from your amp for all the bands. After you do this, loading up your amp is a snap. I might also suggest buying something like the Ameritron ARB 702I {I stands for Icom version}. This will protect the relay is your expensive radio. Here is info on it. I have one for Kenwood and Icom...they work well. http://www.ameritron.com/products/accessories/arb702.html

Date: 1999-04-11 00:00:00 UTC
From: Ralph Mowery <rmowery@ibm.net>
Message-ID: <37104F28.B169A066@ibm.net>
Source record: 111200

Can't help with the ease of tuning, but aftergetting in the ball
park with the tuning, you should switch to full power and do a final
tune with the amp. The amp needs to be tuned at the max desired
power output to give the best linear signal.

Just another reminder of this upcoming event NEXT WEEK! We still have swap tables available!

The Eastern Idaho UHF Society will be hosting a hamfest/computer swapmeet in Idaho Falls, Idaho, at the Elks Lodge on April 17th. This is an ARRL sanctioned hamfest with full license testing, swap tables, commercial, and a talk on the FCC licensing and ARRL, DXpeditions and the internet and ham radio.

We have a web page - http://www.srv.net/~wa4vrv/hamfest.htm

Hope to see you there!

> Thanks,
Dave,
The larger caps should not make much difference to the amplifier
circuits, just slightly lower ripple, and MAYBE slightly higher voltage.

HOWEVER: The turn on inrush current will be higher, as there are much
bigger caps to charge up on power up. This MIGHT cause the bridge
rectifer to fail from the surge, and in the worst case could cause the
power transformer to fail. Also, it is likely to shorten the life of
the power switch.

I would NOT increase the fuse value, but I would consider installing a
higher current rated bridge rectifier.

Lastly, why are you replacing the caps and what amplifier is this?

Actually here on the news groups you can have almost the same security as ebay, if you'll take the time to be careful. You just search for bad experiences with anyone you deal with using dejanews (www.dejanews.com). If people post their bad experiences here that helps the newsgroups to be a bit safer. So thanks to the poster of this "Fraud Alert!"

Do take note of the current, the higher the capacitance results in sharper current ripple that may affect other parts of the circuitry

Consider the Maha chargers - either the one dedicated to the "Standard"
batteries, or their universal MH-C777a charger/conditioner - which will
properly charge about ANY 4.8V-to-12VDC NiCd -or- NiMH pack you have! (And
it's about half the price of the "original" Standard charger,too!)

And Pryme/ADI makes good speaker-mikes for the Standard:

Absolutely. Pre-program the sequence for accessing the autopatch as one of your DTMS autodial memories...and also pre-program the sequence to "close" the autopatch.

Source record: 111220

Hi Larry,

Daft as it all seems, that's pretty much the way you have to go about it.

Rather than go to CW, it's probably better to use FM (for full-tilt-boogie output - best for proper amplifier tuning) or AM (for a bit less drive - better for the two-second tweak for resonance); with both these modes the carrier frequency is 'zero beat' with the SSB signal you've tuned in and less likely to be a bother to anyone on the air, and you don't need to mess with a key; bear in mind though that the microphone is still live... RTTY works, too, but isn't at zero-beat.

Cognizant that tactically one may well have to verify the amplifier tuning 'on the fly' in the heat of the moment and still have to dance the dance, a strategic solution is to lay masking tape around the periphery of the amplifier tune and load controls and spend a few minutes one drizzly Sunday afternoon tuning up the amp on all likely combinations of bands/antennas/modes, marking the positions accordingly. That way you know you're going to be very close very quickly (failing a disaster) regardless. (This is standard operating practice in the contest world, where band changes and re-tunes are a dime a dozen.)

Highly effective, but admittedly with zero points for aesthetics.

Hello. I have the OFS WeatherFAX program and board and like
it.
I am trying to get a hold of Jerry Dahl to see if there is
an updated
version of the program available. I have Ver. 3.0 for DOS
currently.
He came out with a PCMCIA version, but have not seen this
product
or any mention of OFS for a long while. Any ideas if he is
still around?
I left a E-mail for him jdahl@worldnet.att.net with no
response.
Any info is appreciated.

Thanks,
Randy KB8ASO

p.s. The last address I have for him is:

I've been doing as much reading on the NET as possible, and have a CQ-VHF mag on the way, but wanted to through this Q out for your input.

I'm going to use it part of the time in the home hooked up to a sealed deep cycle battery, with a (House)roof mounted antenna. Also will be used while I'm out on the road in my HPV (Human Powered Vehicle - Recumbent Trike).
Does the fact that I want to connect a coax/antenna narrow down my options?
The Yaesu 50-R radio look great, but it has a SMA Jack... does this limit or eliminate the possibility of an external antenna?
What are some options if I want to add an amplifier of say 35 to 50 watts?
Are there affordable 12vdc dual band units?

Thanks in advance for your replies.
Thom

Hi-

Just had my car broken into and my trusty Standard 5718 stolen. I had the rig for about 5 years and it served me well. Now I am looking at the various wares out there and I can't seem to find something that fills the bill. It seems the 5718 is no longer available, and the few radios that are tempting unfortunately have received fairly negative criticism according to my wanderings on the net. The Yaesu ft-8100 sounds great features-wise, but several have reported problems regarding the radio's basic longevity. My requirements are extended receive (108-174, 300-500, 800 and up) and reliability/durability. The monoband FT-3000 looks good on paper, but I haven't heard anything about it.

Any advise besides "get a scanner"?

Josh, N2JLL

Rumor worth mentioning: Icom has a 756 revision in the works called a "756 Pro". Anybody care to comment? I agree that the current 756 is a "better" radio, but I think that the 746 has cut it off at the knees from a marketing standpoint. It kind of makes sense for Icom to do something with the 756 or eliminate it altogether (what happended to the 765?)

I have a one month old 8100 that has a serious "feedback" sounding
squeal when I transmit on VHF. It's not the antenna -- I checked that.
It happens on simplex and repeater operation, with or without PL tones.
It happens on VHF with the subband on VHF, UHF, or totally disabled, and
also on all power settings.

Any clues?

Pete/AL7RH

Yes. What Searoy said.

Also, CAT5 (10/100BaseT) is even more RF resistant than CAT3(10BaseT).
I am in the same boat, as I have CAT3 networking 4 machines; 3 in the shack
and haven't had any (noticeable) RF interference on the LAN. However, I am only

using 2m/70cm bands for transmission. You can also locate some twisted-pair
cable that has an outer shield, but it is more costly. You also need to make
sure the
shield is grounded at the NIC.

10Base2 may be a better option if you are overly concerned. Ground only _one_
end
of the thinnet, but terminate (50Ohms) _both_ ends. 10Base2 NICs and 50Ohm coax

might be free from your friends/colleagues, or dirt cheap at the swap meets.

Then, there's always fiber.... =)

The radio may tune more frequencies but I don't think it will receive
more.
Out side the receiver's limits, the sensitivity is real bad.

Using an H.P. 8920A, here are some out of (Ham) band
sensitivity measurements that I made on my VX-5R.

Freq
MHZ Sensitivity Mode

108 .8 uV AM
135 1 uV AM
140 .17 uV NFM
146 .17 uV NFM
223 2.2 uV NFM
250 20 uV NFM
300 28 uV NFM
350 .4 uV NFM
400 .31 uV NFM
450 .25 uV NFM
500 .35 uV NFM
550 17 uV NFM
630 3.5 uV NFM
675 2.25 uV NFM
700 2.5 uV NFM
730 1.8 uV NFM
815 2.2 uV NFM
850 2 uV NFM
910 1.5 uV NFM
962 1.8 uV NFM
989 3.1 uV NFM
998 2.5 uV NFM

On SW (from .5 to 16 mHZ) it measured .4 uV AM (20 db s/n)

levels are based 20 db s/n

I have a similar RFI problem, but it comes from operating my 40 CW radio and it bothering my 2m radio and the FM broadcast reciever. When I key the 40m radio, the 2m radio goes full scale, and the fm receiver's station increases in noise some. My question is, where I have an indoor 55' dipole (and antenna tuner) located about 6' above my other radios (antenna in attic, me in second floor bedroom), could it just be large RF fields from the nearby 40m radio causing the problem, or is it excessive harmonics from my 40m radio? Thanks.

Message-ID: <371202CE.19ACA37A@concentric.net>
Source record: 111029

I picked up a BC-1031B Panoramic Adapter and intend to recap prior to realignment and use. However, I'm not familiar with 1940's components and don't understand exactly what type of caps to use. The majority are either bathtub or large aluminum can types which are described as "paper - oil" in the tech manual. None of the caps, even in the power supplies, are marked as electrolytics either on the caps or in the tech manual/schematic. Any ideas what types to use to replace the existing caps?
Two of the caps are in the high-voltage filter section, rated at 2,500 WVDC, and one appears to be leaking. Any idea where to get replacements? Thanks for any advice I can get.
Terry (KA5IHV)

>Are Cellular phone are hazardous to health?

Yes, if you try to operate them while driving, or while walking
in a hazardous area. The distraction of the phone could cause
you to have an accident.

>And if you think Cellular phones are hazardous to health, would the use of
>Radiation Shields like the one sold at the URL below alleviate the problem?

No. It doesn't address any credible hazard.

>Please see the URL below for details:
>http://www.goaegis.com/aegisguard_phone_radiation_shields.html

I nicely pseudo-scientific scam (or some really faulty engineering,
see below).

>Additionally, are Analog phones safer than digital ones ?

Probably not. Both can be equally distracting to a person.
An analog phone is ordinary FM, so its output is constant
amplitude except for commanded power changes to deal
with the propagation to the nearest cell site.

A CDMA digital phone's output is also constant in amplitude
in the same manner, though the frequency is rapidly shifting
or "spread", and coding gain can often permit it to operate at
a lower average output power than an analog phone. So if
there were a hazard, a CDMA phone would reduce it slightly
on average.

A TDMA phone does pulse its carrier on and off at a fairly
low rate. There is some evidence that this sort of pulsing
might have non-thermal effects on the brain, but only at a
much lower pulse rate than is used by a TDMA phone.

>Could you plz share Ur experience w/ me?
>Plz advise. Thank U.

The thing to firmly understand about portable cellphones
is that even if the entire output power of the phone were
absorbed by the head (it won't be), the effect would be less
than walking into a room with a 1 degree higher ambient
temperature, or equivalently the difference before and after
a normal haircut.

The quiescent brain generates about 40 watts of heat.
That nearly doubles when concentrating intensely on
something. Blood flow in the brain is designed to handle
that sort of heating rate. A cellphone generates a maximum
of 0.6 watt of RF energy, a small fraction of which could
be converted to heat in tissue.

The amount of thermal insulation change before and after
a haircut has a similar effect on brain temperature as operating
a portable cellphone does, IE a negligible effect. There is no
credible thermal heating problem with portable cellphones.
(There can be a problem with higher power handheld radios
whose output is a substantial fraction of the design heat load
capacity of the brain.)

There is also no credible evidence for non-thermal effects
at cellphone frequencies, though there is some credible
evidence of effects at much lower frequencies, IE in the
range of 2 to 100 Hz, and particularly near 7.92 Hz.
(Aberrant psychological effects have been observed
in subjects exposed to fields near this frequency, or pulsed
at rates near this frequency.) Some electrophoretic effects
are possible too at very low ELF.

Biochemical reactions can't follow the extremely rapid
potential changes of signals above ELF, so there are
no electrophoretic effects on cellular division or other
normal cellular processes at frequencies above ELF.
Since a cellphone doesn't emit any significant energy
down in the ELF range, or pulse its carrier on and off
at a low ELF rate, there is no credible reason to consider
a non-thermal hazard to be present.

Even if a cellphone *did* emit or pulse at an ELF rate,
the shields offered on the referenced website would be
of no value in shielding the head from those effects. They
are simply too small to be an effective barrier at such low
frequencies.

If we are to believe the graph presented, the presence of
the shield *degrades* attenuation of cellular signals by
about 22 dB compared to no shield at all. In other words,
the shield makes the signal to the head stronger! I suspect
that they have accidentally reversed the colors of the so
called surrounding noise line and the unshielded signal line
on the graph to produce this unfortunate result. Reversing
red and green should present what they're trying to present
correctly. (But perhaps the graph is correct as shown, see
below.)

Two things of note here. First, note the roll off in shielding
effectiveness at low frequencies. Since this is the only
area of possible hazard, their own graph shows their system

to be ineffective.

Second, all the graph gives us is dB, which is a relative ratio.
There are no absolute signal levels given. We can infer what
they must be, however, from the "surrounding noise" line. If this
represents ambient thermal noise, then its level is approximately
-174 dBm (dB referenced to 1 milliwatt). If it represents ordinary
RFI at 900 MHz, then it should be between about -110 dBm and
-140 dBm depending on whether it is intended to represent urban
or rural levels. These are extremely weak signal levels. They are
in the picowatt range *before* we consider the effect of the shield!

I called this website's pitch for the product a scam above. It may
well be. But the state of scientific and engineering education today
is so abysmally low, it could simply be the result of not understanding
the nature of what they're trying to do, and not understanding how to
properly interpret honestly made measurements.

I would seriously question the validity of their measurement technique
in any event. If their equipment is actually setup as diagrammed, it isn't
measuring what they claim it is. They're in the far field, and are measuring
the total pattern of the phone antenna, and the effect on that pattern of
their shield. That's not the information that they need to be measuring.
What they purport to shield is the *near field* from the phone body to
an immediately adjacent head. Their setup can't measure that.

But their setup *can* show that improving the counterpoise of the
cellphone antenna will *increase* its signal strength in the far field.
That's exactly what their graph *does* show. If it is not in error, then
it is showing exactly what we'd expect it to show. Amateurs do a
somewhat similar thing to improve the signal strength from their
handheld radios. They add a counterpoise, called a "Tiger Tail",
to their HTs to improve the counterpoise provided by the radio
body and the hand/arm holding it. The so-called shield offered
on this website may be inadvertently serving the same purpose.

In any event, it doesn't do what they claim it does, and even if it
did do what they claim it does, it wouldn't be of any value in
reducing any possible biohazard created by use of a portable
cellular phone. It is junk science at best, an outright scam at
worst.

And most importantly, you're missing the different 3rd order intercept points
of the receiver front ends. The 756 is quite a bit better than the 746 according
to ARRL lab tests. That means it won't fold up under the strong signals found
during contests and Dx pileups (or on 75m at night). That's a much more
important factor than sensitivity (all modern receivers are plenty sensitive),
and more important than selectivity further down in the radio since filtering
there can't undo IMD occurring in the receiver front end (garbage in, garbage
out).

Two things. First, the National Electrical Code requires all grounding
electrodes to be bonded together. You can't use isolated grounds.
If the electrical inspector, or your homeowner's insurance claims
adjuster, sees this, you're hosed and your insurance will be voided.
Second, you've discovered that ill-considered grounding often makes
RFI problems *worse*. Ground is not a noise sink. It is sometimes a
noise source, and it is almost always a path for conducting noise from
one piece of equipment to another. You have to carefully think through
your grounding system to avoid this. The most powerful technique
to avoid this is to use single point grounding technique, also called
ground windowing.

>This has eliminated 75% of the problem. The noise practically

>down the center conductor. When the radio is not connected to an
>antenna there appears not to be any RFI problems, indicating to me that
>the radio's shielding is more than adequate.

Your analysis is probably correct. Grounding is not the correct answer,
however. Suppressing common mode currents on the feedline is the
proper answer to this problem. You need a common mode choke in the
feedline (also called a current balun). This will stop antenna currents
from sneaking back down the outside of the coax to the shack (hot shack
syndrome), *and* it will stop RFI in the shack from sneaking up the outside
of the coax to the antenna, and thus back down *inside* the coax to the radio.
The proper place for this balun is at the antenna feedpoint. That's where it
has to be to properly do the balanced to unbalanced transition. A second

choke near the shack can also be helpful in some cases (and we'd call
it an unun here even though it is the same old common mode choke), but
the one at the antenna is the first priority.

>Both computer and rig are plugged into SEPERATE BX circuits with self
>grounding receptacles. My tranceiver is connected to a half-wave dipole
>with RG8-M (92% shielding) coax. The antenna is not yet grounded(my
>ligtning arrester just arrived today). The ICOM is grounded to the main
>cold water pipe at basement level with #8 gauge copper mesh.

Eeuuw! What a mess! You have unintended ground loops galore.
You need to create a station single point and bond all grounds to it,
and only to it. In other words, pick a point, tie all incoming grounds
to it, and tie all equipment grounds to it, and only to it. You can then
hook that single point to an Earth ground electrode (ground rod)
if you like for lightning protection. The latter should be single point
bonded to all external grounding electrodes on the premises, IE
power entrance ground rod, telco entrance ground rod, buried
cold water piping, etc. Do *NOT*, however, connect to your gas
line. That's a violation of the National Electrical Code, and could
lead to an explosion if you take a lightning hit.

>HERE IS MY QUESTION:
>
>Will a line isolator such as a Radio Works T-4G eliminate this problem
>completely?

I'm not familiar with that product. As noted, what you want is a choke balun.
That can be a few turns of coax coiled up, or it can be several ferrite beads
slipped over the coax, or it can be a twisted pair wound on a toroid (most
commercial ones are made this way). You can buy commercial choke baluns,
but you can easily make your own. (Note, current baluns are always I:1,
other ratios require a voltage balun, that won't do a good job of RFI
suppression in most cases. So even if you need a voltage balun to give
an impedance transformation, slap a current balun behind it for RFI
suppression too.)

This still won't eliminate the problem *completely*. You also need to
deal with the *sources* of the RFI so that radiated RFI won't be picked
up by your antenna. That won't be nearly as strong as conducted RFI
sneaking up the coax, but it will still be a bother.

To do that, first you have to find out the exact sources of the RFI.
It is likely that your monitor is a major source of RFI. To test that,
turn it off and see if the noise goes away. Likely a lot of it will.
Monitors usually have plastic cases, so they have very poor
shielding. Signals also radiate from their power and video cables.
Attack the latter first with snap on ferrite chokes (Radio Shack
sells them). That should help. If more suppression is needed,
you're going to have to shield the monitor case. Adhesive backed
copper foil, or copper window screening, can be used to shield
the monitor (the CRT face is self-shielded by the shadow mask).

You can install the shielding inside the case (looks neater), or outside the case. Get a good bond all around, including to the dag coating of the CRT (hook to the bracket holding the faceplate). That should take care of the monitor. (Note, if you install the shielding inside the case, use fish paper to prevent arcing from high voltage points inside the monitor.)

If there is still noise, scrape the paint from the mating surfaces of the computer case to get a good bond, and add more screws. Good RF shielding requires that seams be sealed by a screw every 5 centimeters along a seam. Snap chokes over cables hooked to the computer too. Any large openings in the case should be sealed with copper screen or foil (don't block ventilation openings). This should virtually eliminate noise from the computer. Now you're left with keyboard, mouse, and other perpherials such as a printer or scanner.

Printers are also often noisy beasts, and you may need to shield yours heavily. This is often a PITA, so just turn it off when you aren't printing. That should deal with that noise source. You can treat your scanner the same way. Keyboards and mice are hard to shield. You can try snap on chokes on their cords, but the best solution is to try different keyboards and mice until you find quieter ones. I've found that the Focus 2001 keyboards are very quiet. I use a cheapy no name $5 mouse that's also quiet. Some of the name brands aren't so quiet, some are, experiment. (Keyboards can make noise all the time, mice usually only make noise when they're moved.)

The secret to good RFI suppression is shielding and more shielding. You don't want to give the noise a chance to get outside the equipment where it is being generated. This has virtually nothing to do with grounding. Hooking up grounds willy nilly gives the noise a way to escape the shielding, the grounding leads will radiate, ground loops will conduct noise, and you'll have more noise problems than when you started (though they may be different problems).

Grounding is important, primarily for safety's sake, but it isn't a panacea for RFI suppression, and you don't need it at all for RF purposes if you're using a balanced antenna like a dipole. (If you're using an unbalanced antenna, like a vertical or an end fed random wire, you do need a ground for RF purposes, but that ground needs to be at the antenna feedpoint, not back at the radio. It needs to be short and direct, easy to do with a ground mounted vertical, harder to do with other end fed antennas.) Get to know *why* you're connecting a ground, and learn how to install a total station ground system properly to avoid ground loops through your equipment. Doing grounding right isn't very hard, but you have to do it carefully or you can cause yourself more problems than you solve.

Do a dejanews search of the rec.radio.amateur.antenna newsgroup on the topic of grounding. I've posted extensively there on the do's and don'ts of proper station grounding. There's a lot of folklore about grounding among amateurs, and even in the amateur literature. You

need to learn to separate fact from fiction here, or you can easily create situations that aren't good, or safe. Remember that Kirchhoff's laws always hold, analyze your system's meshes to see where currents are going to flow. Make sure that they don't flow places you don't want them. Primarily you do that with single point technique. That brings everything to a single common potential. No potential difference, no current flow.

Hello all,

I have just acquired an old regen chassis that I hate to see stripped out for parts. I'd like to restore it and make it operable, but I need to find out what it is first, and if anyone has the schematic. I don't have the coil or tube lineup (I'm sure it's coil, detector, and audio but I'm not sure). The underside components are all there and seem to be in good shape. There is a small inductor shaped like a very thick washer that's loose and I have no idea about. It's hanging under the chassis. A schematic would be very helpful!

It appears to be a Pilot 'kit' - the kind that had all the parts and panels, but you had to drill the holes yourself.

I have photos at:

http://www.boatanchors.com - then click on the link at the top of the page 'Help identify this receiver'.

I'd like to find a schematic, and a replacement vernier for the right dial which is broken. If anyone has one or is at all familiar with this little regen, drop me a note.

Thanks and 73

Hello !

Ii¿½m looking for the cheapest Place to by the FT-50!
Please help me out.

ThanX
Steve

1142. NTIA Narrowband compliant, but still good for ham?

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-12 00:00:00 UTC
From: Scott <GhostRidr@att.net>
Message-ID: <37124A28.250649D2@att.net>
Source record: 111053

In order for me to use my ham machine for CAP, it must soon be NTIA narrowband compliant... I'm finding it VERY difficult to find any low-to medium-level units that can DO this... does anyone have any suggestions?

I'm looking for a VHF/UHF (2m/70cm) mobile unit...I WAS looking at the Kenwood TM-V7A, but it's not on the compliant list... I don't want to shell out big bucks for TWO units... I'd like to find something that will "go both ways"...

Thanx in advance...

-Scott

1144. FS: IC-701/SM2 & RM-2 - New Lower Prices!

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-12 00:00:00 UTC
From: ve5kc@qsl.net
Message-ID: <7etnl5$da9$1@nnrp1.dejanews.com>
Source record: 111055

FS: IC-701/SM2 & RM-2 - New Lower Prices!

IC-701 HF Transceiver /w SM2 desk microphone & manual - $300.00
IC- RM2 Computerized Remote Controller /w copy of manual - $100.00

Package for $375.00

All tested and working. IC-701 is a 9 out 10 with some minor ware to the labels around some controls. The RM-2 is a 10 out of 10 like new in the box only hooked up to test, looks like it was never used.

For more info, picture of rig -> http://www.qsl.net/ve5kc

Yaesu recommends that you DO NOT transmit with the VX-5R connected to the included charging AC power supply.

But it does slowly charge the unit, I believe, with the VX-5R turned "on" for monitoring.

1152. FS: Icom IC-736 HF+6 base, IC-706 HF+6+2

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-12 00:00:00 UTC
From: map@map.COM
Message-ID: <199904120154.SAA11058@mailbox2.ucsd.edu>
Source record: 111063

For sale: Icom Ic-736 full featured base rig 100w, ant tuner, 115 v, hf + 6 meters TX, 30khz-30Mhz, 45-60Mhz Rx. This is a very nice radio and was just completely aligned by Icom. I am the orig owner.

It is only about 3 years old and being the last of these type of rigs without complete tone access for 10m and 6m repeaters, I installed a nice small port on the rear panel to which a comspec dip switch tone board (included) plugs into. The tone board is on 1' cord and is mostly encased in a plastic jacket which makes it kind of look like a computer mouse.

Passband tuning, notch,100+memories, 2 ant ports, Am FM CW SSB (This rig even performs well & sounds good on AM!!) + many more features. Manual, Hand Mike, Outboard Tone Board, Cord, Box

(Cost $2200 new) $1200 + ship & ins

Would prefer a local sale, and will go halfway(up to 50 miles or so) to deliver.

IC-706 , also just aligned at Icom. Works like new , Orig Owner, I have enjoyed this rig since late 1995. Manual, Service Manual(good copy), mike, cord, box.

$750 or offer + ship & ins.

Also would prefer local sale & as above

Actually, buried somewhere in that study released a couple years ago is a portion which noted higher tissue heating and higher possible genetic changes with digitally modulated signals, as opposed to analog modulation. Sorry, can't site the specific part of that study.

Correct. The peanuts with vibration will "flow" to the top side.

The foamboard works, as does multiple layer wraps in two different directions of air bubble sheets which you can rolls at at any office supply store like Staples or Office Max.

I have also heard of good suvccess with "foam in place" packing, but I sure would want to make sure the unit was securely plastic wrapped!

Don't neglect the box. Try to get a double walled heavy duty box and tape all seams securely.

If you pack an item so that it can survive a 5 foot drop on any side or edge, most of the time it will make it through UPS shipping.

Odd as it may seem, some of the guys on alt.guitar.amps know something about filter caps. The best amps (still) for loud, overdriven guitar, are tube driven. Try posting your question there. Typical filter caps in Fender guitar amps are around 600V. I believe the ones you are looking at are electrolytic, but if I'm wrong let the FLAMES begin <g>!

Bill

Using the larger caps may affect the other power supply components. Also, the ripple current rating of your new caps is most likely different than that of the old ones. I ran into this issue with a motor driver circuit. Using a cap with too low a ripple current rating (ESR too high) results in a hotter cap with a shorter life. You may be better off using two smaller capacitance capacitors instead of one or two larger ones.

Hope this helps,
Mike

Midland syntech 6m FM mobile, with small remote head, rf deck, all cables, mic, speaker and Larson trunk lip mount antenna.

This radio is programmed with a slew of 6m repeater pairs and simplex.
(80 Channels)

Works great, just removed from my vehicle after I traded it in.
(now I have a lease, and can't install it!)

$250 or best offer.

Please email replies to: rwalker653@aol.com

Do you have anyting to worry about?
Yes. You will have a better Amp.

Ok so your ripple current will look a little better under normal driving conditions. The difference you will notice is when you drive the power amp hard. Say a 4 ohm sub with lots of herbs.
It this case many amp PSU's can't supply the current necessary between the 1/2 wave pulses of the rectifier, the voltage drops clipping occures etc etc.

In short the larger caps will improve your current ripple at high amplification and load conditions.
Though unless you drive the amp hard you won't notice much difference.

Ok like everyone said your rectifier and fuse might have to work a little harder when you turn the power on.
This depends on the transformer.

If you had an ideal transformer

I = C x dv/dt
I = 0.022 x 75 / 0.005 = 330 A.
assuming 50 Hz.

I doubt your transformer can pump out the 660 A necessary to get the both the original caps up to th 75 V in the first peak of the rectified wave.
More likely the transformer will give you say 3 A short CCT.
So it will take a second or two to charge the 22,000 uF caps to rail voltage, and a second or two more to charge the 54,000 uF caps up to rail voltage.
ie your rectifier and fuse won't be passing that much more current, it will just be passing the current for a longer period. The transformer and rectifier might get a bit hotter but if only for a second more, who cares?
The current won't have change that great a deal.

If you have a REALLLY REALLLY big transformer then the power on current might increase significantly then you will have to replace the rectifier to a higher spec one.

If you are worried, measure the power on current and compare that with the spec on the rectifier.
The bigger caps will make the amp sound better at higher power draw.

Good Luck,
Josh.

If you think Cell phones are hazardous, then do not drive your car. Cars can kill you. I have yet to see one person die from a Cell phone.

Also, do not eat anything. All the vegetables are loaded with pesticides and the meat has hormones and nitrates in it. If you eat you will get cancer and die. This could happen before the Cell phone or Car kills you.

It is either the VCO trimmer caps or a BFO cap. If the voice is real
distorted then the VCO trimmer caps are the problem. If it jumps in
frequency then the BFO cap is most likely the trouble.

The radio may tune more frequencies but I don't think ti will receive
more.
Out side the receiver's limits, the sensitivity is real bad.

Here are some out of (Ham) band sensitivity measurements
that I made on my VX-5R using an H.P. 8920A

Freq
MHZ Sensitivity Mode

108 .8 uV AM
135 1 uV AM
140 .17 uV NFM
146 .17 uV NFM
223 2.2 uV NFM
250 20 uV NFM
300 28 uV NFM
350 .4 uV NFM
400 .31 uV NFM
450 .25 uV NFM
500 .35 uV NFM
550 17 uV NFM
630 3.5 uV NFM
675 2.25 uV NFM
700 2.5 uV NFM
730 1.8 uV NFM
815 2.2 uV NFM
850 2 uV NFM
910 1.5 uV NFM
962 1.8 uV NFM
989 3.1 uV NFM
998 2.5 uV NFM

On SW (from .5 to 16 mHZ) it measured .4 uV AM (20 db s/n)

levels are based 20 db s/n

1199. Re: Shop in Akihabara?

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-13 00:00:00 UTC
From: Sandy Lynch <slay@netcom.com>
Message-ID: <slayFA5556.2MG@netcom.com>
Source record: 110926

All the comments I've seen on this are pretty accurate. Although
I lived in Tokyo for more than 10 years, my current travel there
is only once or twice a year ... so I'm not completely current.

I think you'll find the ROCKET store (their ham hq store) located
around the corner from the JR Akihabara station..... over by
the Washington Hotel, as I recall. T-Zone, in particular, had
downsized their ham equipment selecton from two floors of their
building to one, as I recall..... though others may give you more
current info.

RE: VHF/UHF gear
Note that the JA 2m band is only 144-146 and there are no
repeaters for that band. The 220m band is NOT an amateur
band ... so no products there for sale. The 70cm band is
430-440 MHz, repeaters all have the asme sub-audible tone
acess freq.

RE: HF Gear
Note that 10w and 25w versions of popular gear are plentiful,
for the 3rd and 4th class hams that make up +90% of the licensed
hams in Japan ...

A chum of mine at one of the JA ham equipment manuafacturers
in Tokyo once told me that he could actually get a better
deal buying his own company's products via mail order from
the USA than he could using his own employee discount.
Go figure.

RE: Used gear. Pretty good prices, but the best place to
look is in the classifieds inside CQ Ham Radio magazine.
If you don't read and/or speak Japanese .... it'll be tough.

Regards,
Sandy W7BX - 7J1ABV

Philips PFX85 Hand portable Radios.

I have 5 HSE band (60 - 80Mhz approx) 99 channel hand held units.
they are all programmed with the individual TX RX matching frequencies on
the first 20 channels.

I only have 3 aerials & no batteries for these items, but they are all in
good working order.

125UKP for the lot or 30UKP each (P&P not included)

It is FCC CFR 47 Rule 90.203 (e) which states:
Except as provided in paragraph (g) of this section, transmitters designed to operate above 25 MHz shall not be type accepted for use under this part if the operator can program and transmit on frequencies, other than those programmed by the manufacturer, service or maintenance personnel, using the equipment's external operation controls.

paragraph (g) states:
Transmitters having frequency programming capability and that are designed to operate above 25 MHz are exempt from paragraphs (e) and (f) of this section if the design of such transmitters:
(1) Is such that transmitters with external controls normally available to the operator must be internally modified to place the equipment in the programmable mode. Further, while in the programmable mode, the equipment shall not be capable of transmitting. The procedures for making the modification and altering the frequency program shall not be made available with the operating information normally supplied to the end user of the equipment; or
(2) Requires the transmitter to be programmed for frequencies through controls normally inaccessible to the operator; or
(3) Requires equipment to be programmed for frequencies through use of external devices or specifically programmed modules made available only to service/maintenance personnel; or
(4) Requires equipment to be programmed through cloning (copying a program directly from another transmitter) using devices and procedures made available only to service/maintenance personnel.

Source record: 110934
Cross-posted to: sci.electronics.repair,sci.electronics.design,sci.electronics.misc,rec.radio.amateur.equipment

OK, guys. Here's some guidance from someone that actually used those antiques.

There are some "values" of capacitance that will help you determine the type of capacitor that is needed. Remember, all of the comments pertain to "back then".

The first value is 1 microfarad. Capacitors above this value are usually electrolytic or oil depending on the rated voltage. Over 1000 volts WV is oil, under is electrolytic. These are typically found in the power supply or in tube cathode or screen circuits as a ripple filter, bypass to ground.

The next value is 0.01 microfarad. Capacitors with values between this and one microfarad usually are paper. These are used for coupling/decoupling. Some have voltage ratings up to 1600 volts but this is unusual. Typical is 300 to 500.

Under 0.01 microfarad could be anything, but depending on the circuit, should be replaced with a similar item from todays parts. These type are frequently used in RF circuits and are required to be exact (not like paper) and were made from mica first then ceramic later.

I use a 12v lamp from a "Night Sun" system (bought at the Local Bike Shop) with a handlebar fixture made by Vista-lite, which usually comes with a 6v halogen. I connected it and the HT to a 7 AH 12v gel-cell, (the price was right, $0.00) although a little heavy. I used to use a 2.5 AH gel-cell which cost about $20. I connect to a wall charger when not riding (usually ride to work) and it's always up. I've used the lamp for an hour or so, and the HT on and off for the same time, and haven't noticed any sag in the battery, much less ran it down. YMMV. 73 Jim W5AI

FOR SALE: (A VERY RARE....)

JAPAN RADIO CO. (JRC) NRD-93 COMMERICAL HF RECEIVER.
with: * NVA-92 outboard speaker
* 6.0, 2.5 , 1.0 and 0.3 kHz bandwidth filters
* One- BK Cable (MPKC03108)
* English Instruction Manual
* AC Power Cord (Unit wired for AC 117 Volts)

Includes the following OPTIONAL accessories:
* Cabinet MPBX 10832 for NRD-93 (Standard Light Green Color)
* JRC Scanning Unit NDH-93
* JRC CSD-182 wired remote control for NDH-93
* English Instruction Manual for NDH-93
* Cabinet MPBX 10828 for NDH-93 (Standard Light Green Color)
* 2 Meter Line Out Audio cable
* JRC 2 Meter- 24 VDC Power Cable (MPKC01741)
* Additional JRC IF Filter in "AUX" slot. (0.5 Khz)
* 3- Extra BK Connectors/Covers
* Spare semiconductor kit (6ZXJD00005)
* CMH-330 card extension board
* Extra AC Power Plug
* Extra AC Power Socket
* Extra Foster 1 watt Audio Matching Transformer (identical 600 to 8 ohms as is in NVA-92 speaker).

Unit(s) and accessories are in "excellent" physical and electrical condition. All is 100% operational, no problems what-so-ever !! I do not have the original box or packing. But alt. packing to ship just fine. Unit was purchased new in 1989.

I'm a NON-smoker..

TERMS:
Price $ 3850. FIRM !!. BUYER PAYS ALL SHIPPING !!! USA offers only !! Cashier's Check or Money Order , NO COD's !! Please e-mail DIRECT if intrested.

>electrolytics or not.

No, they are not. In the 1940s, elcos were not reliable enough for the
military, especially in hot climates. They are paper dielectric, oil-
immersed.
> Others are multi-section bathtub type caps scattered throughout the unit.
>None
>of those indicate any polarity either. If they are not electros,

They, too, are paper.
> I thought I'd
>replace them with Sprague Orange Drop Polystyrenes.

Why polystyrenes? They are very costly compared with polyester types,
which are perfectly OK to replace paper.

> Some of the caps are leaky and have spilled some of the sticky oil out so I

I have been unable to locate a complete and very
readable schematic for a RCI-2950 10m transceiver.

Everything I have seen or received is missing information.
Does anyone out there have a schematic that is crisp,
clean, and complete?

Will pay reasonable copy and postage as agreed in advance.

Also need a replacement display module. Your offer or
information as to a reasonably priced source would be
appreciated.

Thanks! & 73,
~~~

> Pete/AL7RH

Hello Pete: Can you try it with a dummy load plugged in instead of an aerial, to see if the problem is some way related to pickup in the mike lead or power supply, etc... monitor your transmitted signal with an HT or whatever... get back to us when you've tried that.

Also, to be honest I would have thought you could return the set under warranty if it is so new, so I presume you are tyring to eliminate the obvious before doing so.

Tony-
Saw your post...I believe the award is sponsored by CQ...pick up a copy or visit their website...i seriously doubt the ARRL would appropriate the name for an ARRL zone-type award..

best.

Don

My friend bought a couple of these things -- FRS 1400. Apparently, the FRS 1600 is the same thing with PL tones. We were wondering if there was a mod to enable the tones. Is there a jumper or diode placement or removal? Is it a multi button sequence, add a chip, some for of reprogramming?

If anyone has an idea, please let us know.

Yea, sounds like it made both my radio shack 202 and 212 illegal too,
both can be extended to mars/cap (non amateur) freqs with a few key
presses, and the instructions are in the manual (paragraph g).

Source record: 110957

Yes. What Searoy said.

Also, CAT5 (10/100BaseT) is even more RF resistant than CAT3(10BaseT).
I am in the same boat, as I have CAT3 networking 4 machines; 3 in the shack
and haven't had any (noticeable) RF interference on the LAN. However, I am only

using 2m/70cm bands for transmission. You can also locate some twisted-pair
cable that has an outer shield, but it is more costly. You also need to make
sure the shield is grounded at the NIC.

10Base2 may be a better option if you are overly concerned. Ground only _one_
end of the thinnet, but terminate (50Ohms) _both_ ends. 10Base2 NICs and 50Ohm
coax might be free from your friends/colleagues, or dirt cheap at the swap
meets.

Then, there's always fiber.... =)

> with the customers !! 73 to all

What is your point? Are you claiming that Bird watt meters do not
meet their specified accuracy?

Your comments raise a few questions, such as how do you know that the
true power was 40 watts and what were the ranges and conditions of
the Bird elements with which you made those measurements? And also,
if you were serious about the last comment there's the ethical
question of why you were showing a reading to your customers that you
believed was false and fully 25% greater than the true power.

New standard Bird 43 meters are specified at +-5% of Full Scale in
carrier mode (and +-8% in PEP mode where that's available). So, even
if the true power was 40 watt (and you didn't explain how you reached
that conclusion), then measuring it with a new meter and new 250 watt
element will not guarantee a reading any of better than around 237 to
263 watts, and using an old and mishandled meter and element of any
rating may also not give a particularly accurate measurement.

Hi, Dave.

I talked to a friend of mine who is very knowledgeable about these units, and he seems to feel this was likely a homebrew. From the photos, it seems there are three tube sockets. One would be used for a coil, another for the regenerative stage, and the third for an audio amplifier. The transformer was likely an interstage between the regen and audio. The (magnetic) earphones would typically be hooked to the battery and plate of the audio amplifier.

It looks like a battery set - that is the tubes were directly heated filament/cathode. It was hard to tell from the pix whether the tube sockets were four or five pin. The resistance control is likely to adjust filament voltage, and the presence of a transformer in the regen circuit was more typical of battery sets than later "AC" sets that used tubes with indirectly heated cathodes.

Regarding the schematic. You are probably best off by finding a typical regen schematic, then tracing out the wiring in your set. There were many minor variations but all followed the same basic approach. From the size of the tuning capacitors (one was tuning, the other is likely a regeneration control) it looks like it was built as a short wave receiver.

The coil will probably take some educated guessing, but if you can find a typical schematic, you might borrow the coil winding data from that project. The coil windings are probably not too critical provided you have the basic windings and taps hooked to the proper places.

It should be straightforward to make the set work again, after all these years. Good Luck!

Hi All,

After Drake's 4NB didn't do much for me on my QRN I decided to cobble something together that would work. While it is still a work I'd like to improve, I have something that works a whole bunch better than the 4NB. I used Ten-Tec's Model 297 accessory blanker for the Scout. The details of the project are on my web site. See them at:

http://www.wwc.edu/~frohro/R-4C/NoiseBlanker.htm

If you have any suggestions, I'd love to hear them.

73,

Rob, KL7NA

I have decided to move some of my big iron to make room in the garage.
Actually, She WHo Must Be Obeyed suggested it.

The following can be delivered to the Belton, TX hamfest this weekend,
17 April. If you are interested send me an email or give me a call
for additional information. All are in VG to excellent condition,
a.k.a., no dogs. None have obvious mods. All are complete. None have
been restored. Manuals are available to copy. Untested as of right
now unless noted. I may have time to give a "light up" test before
Saturday.

1. CE-100V - $225
2. SX-42 - $175 (works)
3. HT-37 - $75
4. HT-41 with 572B finals - $250
5. HT-32A - $125 each for two
6. Apache - $150
7. Mohawk - $150 (works)
8. Marauder - $150
9. Warrior - $250

Thanks in advance and best 73,

Pete....I also have a "feedback" problem with my FT8100. When I
transmit on UHF for over a minute, the fan comes on and people listening
to me say I have a squeal or tone on my signal. It only happens when
the fan comes on, and only on UHF. Yaesu, USA says that it is unusual
and that I should move the antenna lead around.....Not much help..Dale

Just another reminder of this upcoming event THIS WEEK! We still have swap tables available, but may run out!

The Eastern Idaho UHF Society will be hosting a hamfest/computer swapmeet in Idaho Falls, Idaho, at the Elks Lodge on April 17th. This is an ARRL sanctioned hamfest with full license testing, swap tables, commercial, and a talk on the FCC licensing and ARRL, DXpeditions and the internet and ham radio.

We have a web page - http://www.srv.net/~wa4vrv/hamfest.htm

Hope to see you there!

1256. Re: => Best all around Dual Band HT?

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-13 00:00:00 UTC
From: Shawn Upton <supton@eece.maine.edu>
Message-ID: <37134169.167E@eece.maine.edu>
Source record: 111009

I can't tell you which one I would buy, but I can pass along a bit of advice. I used to own the FT-50, which I tried to do the things you did (HT, home radio, and radio while in truck). I bought the SMA-BNC adapter, and used that for a while with a BNC antenna that I bought. Worked ok, but I finally broke the radio one day when I accidently sat on it. (Fixing that radio isn't that hard, but I felt real stupid after breaking such a rugged radio after sitting on it). The problem with SMA-BNC adapters is they add length to the antenna connector, which means they can be broken much faster. Nothing wrong with the radio if you use a SMA antenna though.

However, for all the antenna swapping that you plan to do, I would recomment getting a radio with a BNC on it. I think you will find it easier.

By the way, I am planning on adding a J-pole to my bicycle in the near future; I'm not sure if I will use a length of pcv pipe to support an all-twin lead antenna, or if I will use a real "whip" of some sort to give it a real mobile antenna look. I'm not sure, but a 2m J-pole might be usable on 70cm; I've heard that it might be but I've never tried it out. Personally, I wouldn't try to use the amp on the bike; the battery needed would be too big. However, there is a 4Ah battery from Radio Shack that would make a nice battery to go all day long on the bike.

Also, the FT-50 has a weird 4 conductor single pin connector for the external speaker/mic. Not a problem if you order one from MFJ/wherever (the price is pretty good on them) but you can't go down to RS and buy one, or use one of the older designs. And, the location of the DC jack on the radio is on the side, towards the bottom, which might add to some problems with figuring out how to power the radio while on teh bike.

As for amps, they are out there. Dig around in a QST, I know that they exist. Hope to have been of some help.

Why not replace the mobile's antenna plug with a SMA plug to match the FT-50?

> What are some options if I want to add an amplifier of say 35 to 50 watts?
> Are there affordable 12vdc dual band units?

For mobile or base use?

Mike, I have an old piece of 1940's military gear which has some large aluminum can caps the technical manual calls "paper - oil". I can't tell if they should be electrolytics or not. The tech manual, the schematic and the caps themselves show no indication of polarity. Some of them are in the high and low voltage power supplies and I thought surely those would be electrolytics.
Others are multi-section bathtub type caps scattered throughout the unit. None of those indicate any polarity either. If they are not electros, I thought I'd replace them with Sprague Orange Drop Polystyrenes. But, I'm hesitant until I find out about the electros.
Some of the caps are leaky and have spilled some of the sticky oil out so I know they definitely need replacement. Any ideas? Thanks.
Terry

Oscar:

I've taken my TS50 up to mountaintops and worked a LOT of DX, especially on 10m (small, light antenna). Mostly CW from pre-charged BIG batteries (a friend hauled, not me). I used a slinky dipole strung on monofilament line between trees.

Here's what I'm working on for the next expedition:

For power I'd use a 12VDC gel-cell (motorcycle size) battery, 64W flexible solar panel (3'x4' flattened) on a heavy duty tripod, and charger/controller.

For antenna, I'd go with a telescoping aluminum mast with a Hustler "spider" style multi-band radiator. I'd guy the top of the mast with AT LEAST 4 light wires to act as radials. If you want to get fancy, you can pre-cut these for different bands and use alligator clips to jumper the appropriate sections together.

If you're careful with your power you can do a LOT of short QSOs, especially CW, on this setup.

Happy DXpeditioning!

Source record: 111020

I've had that upgrade done and it was definitely worthwhile. Price was $125. The QST I received yesterday (May 99) agreed with it being a good upgrade (they had previously reviewed the non-upgraded model).

In my case it was easy, since there is a Kenwood service center about 20 miles from me; drove it there on a Fri and picked it up the following Mon.

But you asked "What do I have to do, if I want to upgrade?" From your call and email address, the logistics from your location may be very different. I suggest you contact the Kenwood service center for your area and see what they say.

Phil

Hi there! :) I'm an electronic musician seriously searching for old
electronic musical equipment from the 1960's-1980's. I will consider
anything, in any condition - even broken units or parts:

-Old synthesizers (knobs or sliders preferred but not necessary)
-Old drum machines
-Old sequencers
-MIDI equipment
-Effects processors
-Vocoders

Moog, ARP, Sequential Circuits, Oberheim, Roland, Korg, Yamaha, EMS, EML,
Buchla, Serge, Ionic, PPG, Digisound, Paia, Aries, E-mu, Polyfusion,
Steiner-Parker, Mutron, Maestro, Electro-Harmonix, anything similar.

Roland TR808 Rhythm Composer
TB303 Computer Controlled Bassline
Synton Syrinx
Gleeman Pentaphonic CLear
PPG Waveterm or Wave series
Digisound modular series
Maplin kit built synths
EMS Synthi 100

For a better idea of things I am looking for, please see:

http://members.aol.com/rolandman1

If you have anything you'd consider parting with or know someone who might,
please email me at rolandman1@aol.com
Please respond privately and include your phone number as well if you'd like.

Thank you very much and apologies in advance if this message bothers anyone.

Jan-

Good luck in finding the antenna. If you are not successful consider
an alternative.

IMHO, Gap IV is a pretty expensive antenna for what it does. I suggest
that you consider a homebrew vertical dipole fed in the middle with
open wire line via a used Johnson Matchbox. If you are not running
over 250W output, the Matchbox Jr's show up pretty regularly in the $75
range. I have used this type of antenna and they work very well if one
is stuck with room for a vertical only. The best performing installion
here was a 40' pole with a piece of fiberglass rod in the middle. It
was mounted right outside the 2nd floor shack window and fed with
a little 3' piece of twinlead with the tuner next to the window.
The 40' worked well on 20, 40, and 80. If you want 10-40 with
best performance on 30, 20, 17, and 15 a 25 foot or so overall is
probably better.

That is correct. It is not speced at 5% of the reading, but of full
scale.
That means it could be way off at the lower power readings. Lots of
meters becides the Bird watt meters are speced that way, that is why
for the analog meters, you should try to get the reading on the
upper portion of the scale.
The scale is not linear and the diodes are very poor in calibration
at the lower levels. They are operating in the square low reagon
and could be way off.

I will agree that the Birds are usually more accurate than that. I
work with lab instruments calibrating other instruments every day
and find a quality instrument will normally beat the specs by a
large ammount under controlled conditions, but if they are operated
in a very hot area or very cold area, they can 'drift' near the
limits. Don't know about the Bird, but suspect if you place one at
the extream ends of the temp range, it will be luckey to hold as
near as 2 or 3 %.

Virtually all test equipment manufacturers guarantee and stand by the accuracy of their instruments. Certainly all the companies I worked for did. I've spent many, many hours writing specifications, verifying them, and establishing that I had with high confidence that all instruments would meet their published specifications. The specifications are written so they can be met. If the accuracy of the Bird 43 wattmeter is not specifed at some points on the scale, as you say, then it's useless for making any kind of meaningful measurement, as is any piece of test equipment with unspecified accuracy. I'll qualify that to say that it's useless unless you've specifically calibrated it against a standard which does have known accuracy. (Incidentally, I've heard that at least on some of the ranges, the Bird is near the lower end of its spec at one end of the frequency range and near the upper end at the other. I haven't investigated this personally, though.) I believe that the reason Bird gets by with such a sloppy spec is that they don't have any serious competitor that's willing to guarantee a better one. Or perhaps the market for their instrument feels as you do -- that hey, what the heck, I know they're pretty good.

You mentioned the calibration of the Boonton meter. (I apologize for cutting the quote too quickly.) I'll bet that if you were to send the Bird 43 meter to the calibration lab and it measured 30 watts with 40 applied, or even 12 watts with zero in, it would be returned as being in calibration. You might check this with the lab. Most labs will return a meter as calibrated if it meets its spec. If it has no spec,

it can't be calibrated. The fact that the Boonton was returned as calibrated doesn't mean that it's dead on, only that it meets whatever spec Boonton or your company put on it.

At this point it's clear that you have an entirely different approach to measurement verification than I do, so this is probably a good time to once again go our separate ways.

For Sale or Trade:
Drake MS-3, AC-3 speaker/power supply. Front of speaker is super but cabinet needs repainted. (There are no dents and Krylon matte black spray paint matches the Drake gear quite nicely). Driver sounds fine. (No buzzing). AC-3 power supply appears to be all original parts and was tested about 4 months ago on a TR-3 transceiver and it was delivering all required voltages. Will not seperate units.

I have advertised these before but grossly under priced them. The price is $100 + shipping firm or will trade for older Kenwood or Yaesu 2 Meter mobile (synthesized) or Radio Shack 2M HT and you pay shipping.

E-mail W4UDX@juno.com

In all my years of working with instrumentation in the mechanical, electrical, and chemical areas, my training and experience tell me that Roy's understanding of percent of full scale is correct. If a manufacturer specifies percent of _reading_, that is exactly what is meant. But percent of _full scale_ is quite different - the actual reading can be in error as much as this percentage of the full scale reading _anywhere_ along the scale. In general, stating accuracy as percent of full scale is done to make a poor calibration look better than it actually is. For those wanting to quibble about definitions, ISA (formerly Instrument Society of America, now International Society for Measurement and Control) publishes a number of International Standards giving definitions of all of these terms.

I suspect Bird is just lazy in not giving better accuracy statements. For example, I have seen precision digital instruments specify accuracy as X% of reading + Y% of full scale +/- 1 count. In this case, the X value relates mostly to how well the true reading matches the divisions of the instrument's scale. The Y value relates more to the errors obtained when switching from one scale to the next. Finally the +/- one count relates to the ambiguity of the digital electronics (such as a counter or A/D converter).

What Bird really needs to do is present a calibration curve of actual value versus indicated value. Added to this should be two additional curves, one above and one below, indicating the 95% confidence limits as determined for a large number of instruments. This sort of statistical accuracy presentation is expensive, obviously, and I doubt if Bird will ever give one.

Percent of full scale is, in my opinion, a cop-out for Bird. Whenever accuracy is stated this way, it means the actual accuracy of any reading will always be worse than the full scale accuracy (unless the reading IS full scale, in which case the accuracy is the full scale accuracy).

1283. Just got my RX320

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-14 00:00:00 UTC
From: mariner <thousandislands@mediaone.net>
Message-ID: <j%cR2.9753$tY1.6913@wbnws01.ne.mediaone.net>
Source record: 110836

Hi, Group:

I ordered my RX320 yesterday (04/13) and got it today by FedEx overnight(Yep...they're in stock). Some first impressions:

1) NO digital hash from my Gateway Select K6-2/366 or SONY Multiscan 15 sfII monitor. Noise floor is unbelieveable. Dead quiet.

2) Nice construction of the unit. I expected kind of a cheesy box considering the price, but it's solid and well-built. What is cheesy, however, is the 9-pin cable included with it. Had to bend 2 of the pins back into place before I could plug it in. Note that the included manual suggests locating the black box as far away from the computer and monitor as possible. So why not include a 12' cable and audio patch cord???

3) Whip is black, not chrome. And just barely worth the trouble of installing it.

4) This radio rocks with an outdoor antenna. Mine is just a 40' random wire sloper, but with just that wire, it is extremely sensitive! In fact, more so than my SONY ICF-2010.
Reception is moderately better on DX signals like Radio Tirana and Radio Malawi. I know the 2010 attenuates signals when using the external antenna jack, but I have been getting around it by using an Ameco TPA antenna tuner/preamp with the SONY, and it's great to pre-select frequency ranges. I chose the TPA because it tunes into MW as well and I do some BCB DXing. I'll try this setup with the RX-320 as well, even though the 320 attenuates BCB signals. I'll hook up the 320 and the TPA and let 'em fight it out!

5) I'm trying all three softwares (haven't sprung for ERGO yet): Ten-Tec's included software, KF5OJ's (great job!!), and Privalov. Yes, Ten-Tec's is prettier, but Cliff's is hands-down better in terms of flexibility (all filters available; scheduler; and virtual squelch, volume and line-out pots). Time for an upgrade, Ten-Tec!

6) Audio is exceptional, especially with a good sound card and Cambridge Soundworks 3-piece speaker system! Good to Very Good dynamic range so far.

7) Caveat: These software installs do not let you choose a COM port higher than 4, and all four of mine are in use. I could install COM Port 5 and shift something over to it, but that's a pain. My 320 was immediately hot on COM Port 1 out of the box. You should check before buying what ports are available to you, especially because this isn't a PlugNPlay setup, a consideration for WIN95/98 users.

From: Mark White <markw@iconnect.net>
Message-ID: <7f3qs0bii1@news.iconnect.net>
Source record: 110840

I just replaced mine this week, here is what I did:

First, the battery is a 3 volt lithium, type 2016 with solder tabs. Radio shack didn't have one so I bought the fattest one they did have, I believe it was a 2032. As everyone says, remove the 2 front allen screws and the panel comes off. I also removed the 5 phillips screws holding the top cover on NOTE- the large phillips screw in the back of the cover does not have to be removed, just loosened. When everything is apart you can see the battery stuck to the cpu with adhesive, a double sided foam tape type of stuff. Everybody hass their own way of doing things, I snipped the battery leads with a pair of cutters, peeled the battery off, then desoldered the lead ends. Do it however you want. Then I soldered about 3 inches of thin wire to my new battery and soldered the other ends to the places where I removed the solder tabs. My technique for soldering to the battery is to use thin solder and wait 5 -10 minutes after doing the first side to do the second side, letting the battery cool down. Anyway after the battery is wired in wrap it in electrical tape, then tape it to the exposed pc board under the top panel. Works like a champ, takes less than 10 minutes, and the best part is the 2032 cell has nearly 3 times the capacity than the stock 2016 cell has (225 mah vs 80 mah). Not bad for 3 dollars. Of course if you try it do it at your own risk.

It is not correct. High quality meters of all types routinely specify full scale accuracy. Because of quality control of the relationship between "deflection" and "input" they can mark the scale with considerable confidence. The accuracy degrades "gracefully" below full scale.

I definitely do not agree with your comments on this. They are contrary to my experience with high quality laboratory analog meters of many types.

> accuracy of their instruments.

5% of full scale is 12.5 watts. The error at 40 watts (or 12.5 watts) cannot be "assumed" to
also be 12.5 watts by any reasonable person. That is nonsense and anyone who knows anything about analog meters knows that it is nonsense.

The % error in any high quality analog meter degrades "gracefully" as you go downscale. The errors at less than full scale are definitely related to the full scale accuracy. Pick up a catalog of meters and you will see that the full scale accuracy is what is specified. That does
not mean the meter is "junk" at other readings.

Here is the main idea. A properly designed D'Arsonval meter maintains a certain definite relationship between "deflection" vs "input" over its range. The full scale accuracy is correlated to that relationship. Because of that relationship the scale can be marked with considerable confidence across most of the scale. At this moment I am looking at a Simpson catalog that specs full scale accuracy. Yet the picture shows finely spaced markings all across
the scale. Is this some kind of "fraud"?

Hogwash.

Meter designers and manufacturers learned long ago how to deal with this problem of reproducibility, so that "one" meter scale can be used over and over.

For a rectifier meter the rectifiers do introduce a problem, but with quality control this problem is manageable, and is responsible for a slightly relaxed spec for this kind of meter.
AC meters also have a crest factor problem.

> If the accuracy of the
> Bird 43 wattmeter is not specifed at some points on the scale, as you
> say, then it's useless for making any kind of meaningful measurement,
> as is any piece of test equipment with unspecified accuracy.

My experience with my 43, with its 2-30 MHz elements, is that it is quite "accurate" across most of the scale within that frequency range.

> I'll bet that if you were to send the
> Bird 43 meter to the calibration lab and it measured 30 watts with 40

> in calibration.

Baloney. It would be sent to the factory repair shop.

> Most labs will
> return a meter as calibrated if it meets its spec. If it has no spec,
> it can't be calibrated. The fact that the Boonton was returned as
> calibrated doesn't mean that it's dead on, only that it meets whatever
> spec Boonton or your company put on it.

It meets the requirements that Boonton says it supposed to meet. And when it is adjusted at full scale, it is very accurate across a 13 dB range, as determined by accurate RF attenuators.
I have been using these meters for 30 years and I know their quality.

As for going separate ways, go which ever way you like. If that is the way you want to behave
toward me, I couldn't care less.

Do you really think you'll sell more product by being obnoxious and cluttering up the newsgroup with frequent advertising? If you're rewarded for this behavior, I foresee the day when the newgroups won't have any postings except ads like this. (This has already happened to some.) So I sure hope no one responds to this by buying your product.

The expanded receive mod (power up function) gives 800mhz images in the
900mhz range with 30khz spacing...
I personally believe they made the display to read 900mhz, but it
actually receives 800mhz.

1293. FT-8100 comments wanted

Hello everyone....

I am currently considering buying a Yaesu FT-8100 to
replace my Kenwood TM-V7A in the vehicle.

I already read a couple of posts concerning problems
with the FT8100 but I want to hear more, does it seem to
be common that people are generally having to return their
first and sometimes second replacement due to problems?
Or has Yaesu fixed them? I need to know before I go and
try to correct one mistake with another mistake, especially
at $450.00 a pop.

I've always used Kenwood ever since a bad experience with
Icom. And up to this latest mobile, I've been pleased with
my Kenwoods, own the tm-211,221,231,241,had a 251, and now
the tm-v7a (which i want to replace) And the only real reason
is because of the display. It just can't be SEEN in the
daylight!!! I've done everyhing I can think of to make it
more readable but during daylight I have to gaze at it just
to figure out what I'm doing... If it wern't for that I would
not replace the TM-V7A.

So I'm considering the Yaesu FT-8100, but don't want to get
rid of a rig causing me problems for another one that will be
causing me problems. Please respond to this post with your
experince good, and bad... thanks...

With a 250 watt element, +/-5% of full scale is +/-12.5 watts. So it
can read as much as 52.5 or as little as 27.5 watts with a 40 watt
power level and still be within its specified accuracy. If you want
better accuracy than this you'll have to use a different instrument,
or perhaps get the meter specially calibrated against a known standard
of greater accuracy.

People frequently misunderstand the 43's spec to be 5% of reading.
It's not.

Additional equipment has become available for the Belton trip this Saturday, 17 April.

If you are interested send me an email or give me a call for additional information. All are in G or better condition. None have been restored. Manuals are either available or available to copy. Untested as of right now unless noted. I may have time to check for smoke before Saturday.

1. Globe King 500 (not sure which model but no VFO; missing rear door, needs work) - $300

2. Heathkit DX-100 (2 units; one nice one has a modulator problem; other is untested) - $150 for both

3. Hallicrafters SX-25 - $125

I had the idea to use a Windows CE unit (Compaq h/w) as the terminal for my mini packet station, the Kenwood TH-D7A. This creates a very small but powerful packet station with one slight problem. Since the real (pg-4w) cables from Kenwood are not yet available (I'm told they are backordered), I used the 3/32" 3 conductor plug with 4ft of wire provided in the box by Kenwood, and added a DB9 to the other end. While the data connectivity works flawlessly, the RF situation couldn't be worse. As soon as I bring the cable (connected to a running CE) close to the D7A, RF hash appears. If the cable is actually plugged into the radio, all but the strongest signal are obliterated. I've tried another CE unit, an HP 660, and get the same results.

Has anyone else tackled this problem? Does the Kenwood cable (the pg-4w, if you can find one in stock) fix the problem? My guess is to use a torriod and wrap the cable around it, but I don't know how to calculate the torriod/windings to create a choke to cleanup this RFI. Any info is appreciated. 73's

This is not correct.

Within the past month or so, I purchased a *new* Model 43 with a *new* 250H element. I compared it with a recently calibrated Boonton Model 92B RF voltmeter and 50 ohm load setup. The readings compared as closely as I could read the scale at all levels from 10 watts to 250 watts. I found this to be impressive. I found the accuracy to be quite a bit better than the "guaranteed 5% of full scale".

The meter scale on the 43 is highly compressed at full scale but spreads out greatly at readings below full scale and is easier to read. For example, midscale is about 80 watts. At 40 watts the error is not +/- 12.5 watts for a 250 watt element. It is definitely not off by 31% at 40 watts.

5% of 250 watts does not imply 12.5 watts at "all" meter readings. That is not what the term means. In fact, the term doesn't really say much of anything about the accuracy at lower readings.

The manner in which they mark the meter scale indicates the confidence they have in those markings. The validity of the markings is verified at the factory, where they have made more than 230,000 Model 43s. The skeptical owner should verify this for himself, as I did.

The nonlinearity of the meter scale has to be considered.

I also checked my new 1000H element with the same results.

National NC-270 and matching speaker in very good condition. Includes original manual. Ham band receiver 80-6 meters. No WARC (of course)

Bid is at only $52.01 right now.

Great for 6 meter AM this summer.

This is a really nice radio in the famous "Cosmic Blue" color. The picture does not do it justice. Please take a look. Thanks.

Your "local acquaintance" is not giving you good advice.

ADI has built their reputation on good products, excellent value for the
money, and great customer service.

The amount of money you save by purchasing, say, their AT-600 over the
competition could buy an extra NiMH battery for the unit!

Which part of my statement is not correct: That the Bird accuracy is not as I said, that readings of 27.5 to 52.5 watts for a 40 watt signal are within its specified accuracy, or that you have to use a different instrument to get better accuracy than this? If you're referring to the last of this list, is your sole evidence the measurement of a single new meter? Certainly, any single meter or even the vast majority of meters could be much better than the specification. None should be worse. And a given one can be calibrated or verified to better than the specified accuracy, as I suggested in my posting. But it's perilous to infer the accuracy of all meters from a single sample. If all Bird meters were as good as yours, it would be foolish for Bird to specify them so loosely.

If "5% of full scale" doesn't mean 5% of full scale, then what does it mean? If I measure, say, 40 watts, exactly what range of power could actually be going through the meter with certainty guaranteed by Bird? If they can't specify a range of values, then there is no specification at all. I say this as a person who has spent most of his career designing test equipment, all with carefully defined specifications, although this is very basic metrology.

Out of curiosity, what was the specified accuracy of the Boonton you compared it with?

Hi Jim,

I have been running a FT-8100r for the last six months and have not had any problems at all. I use the separation kit with the radio mounted under the passenger seat.

The radio has met all of my expectations so far. On two meters I don't get as much intermod in places my old rig would go nuts.

The dual receive capabilities are nice. On my 60 mile Monday morning commute, I can chat on two meters and use the other receiver to listen in to the traffic reporters.

It can be frustrating to try to judge a radios performance from comment on the newsgroups. When someone has a radio that is working fine they don't need to post anything about it. So most posts you see tend to be about problems they are having.

try several wraps of the cable around a toriod Steve - a lot of computer cables have them. Also the length (harmonics) has plagued me in the past as well - you may try that.

Saber 1 uhf 12ch
6D core, H/pwr, non secure
Model # H44SAN7139CN
comes w/ 1 batt.motorola used (not so good)
plus 1 brand-new batt motorola (7.2v @ 1800 ma)
& ant. the shape of the radio is in
good shape I'll give it a 7.

*** Note ****

Asking $240.+ you paid for S+H

**** Need to read radio for band spread ? ****
Don't know band spread!

I'm not going to paid someone $40 or $30 so i can read
the radio. If I'm not going to kept it.

Then i used my scanner to see what were the
CH. And this is what i found.

Ch. 1 447.285
Ch. 2 449.925
Ch. 3 460.000
Ch. 4 460.500
Ch. 5 449.125
Ch. 6 447.125
Ch. 7 --- Blank
Ch. 8 --- Blank
Ch. 9 --- Blank
Ch. 10 --- Blank
Ch. 11 --- Blank
Ch. 12 --- Blank

Save $40 or $30.

And this is why I'm selling it!
1) I got it with a trade!
2) It cost to much for me to keep this radio.
I would need a charger, software, cable,
rib box and get this a 386 computer. Ha

You can e-mail me

"
> with the customers !! 73 to all

The reason for using Bird 43's is that they are consistant in there
readings from meter to meter and are resonable in cost. Sure you
can make all sorts of arguments for meter accurarcy, but the service
industry needs consistancy. The biggest cause of inaccuracy is
zeroing the meter with the screw on the front. The meters should
be calibrated against a know standard periodically, this is for meter
consistancy not absolute accuracy.

Bird over the years has been the leader in RF power measurements
and is the standard in Broadcast and commercial communications.

Measuring true RF power is very complicated business to get absolutely
accurate measurements. The Bird meters solved the problem of consistancy
with simple dependable instruments. It might be noted that they do measure
average power harmonics, spurs and all. Just because the Bird says you
are reading 50 watts it doesn't mean that all the 50 watts of RF is on the
carrier frequency

Each one of the slugs is individually calibrated over the range
printed on the front at the rated power level and are guaranteed
across the freq. range. The idea is to have 50 watts a 50MHZ to
be the same as 50 watts at 500MHZ.

I have a Sharp Mobilon and it works great with my TH-D7a. I am using a homemade cable that is attached to the Mobilon cable. The mobilon cable does have a torroid coil nearest the HPC.

Hope this helps,

Walter

There are many reasons to "hide".
I get net access as a perk with my job.
Last year I nearly got fired and/or lost my "net" access due to the
unholly amount of spam that one little post brought.
If anyone really wants to spend the time, they could almost certainly
track me down. Any police agency would have no trouble "backtracking",
but the spammers are not that resosurcefull. Yet!
So, to any and all that dislike me hiding, tood bad, it is not going to
cange. It is either this, or lurk only.
And I like to think that I have at least a little to contribute.

1319. Kenwood TR7950 operation?

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-14 00:00:00 UTC
From: 5mbv@airmail.net
Message-ID: <80B1F1876D244776.B5A18B6E38608040.E3814224E4FA0FD5@library-proxy.airnews.net>

I aquired a Kenwood TR7950 with no manual in a trade. I don't seem to be able to change freq using the keypad. I also need to set a tone freq and pressing "TONE" sets up a screen that looks promising, but nothing can be input via any of the controls. Can anyone tell me how to operate the keypad controls to set up subaudible tones?
Maybe there is no tone module or the tone is just a tone burst type?

Thanks, Ken K5MBV

Hello,

Just wondering if anyone who has ever worked with the
DM-3472 UHF Transceiver. It's from Johnson Data (johnsondata.com).

We're getting some strange behavior. Every once in awhile after a
power cycle, the radio permanently looses it's transmit frequency.
The radio has a loader that contains a small processor and EEPROM
to load the radio's synthesizer with a frequency. Occasionally,
the transmit frequency gets set to 268.41250MHz. It's quite stange.

I'll go into more detail if anyone is interested. I've contacted
Johnson but no luck getting ahold of them yet.

Thanks.

Steve,

I think that a single large piece of ferrite would do the trick with
only one pass through it. Look at how the power supply and other cables
from many laptop computers have those characteristic parasitic lumps on
them. I think that's what you need.

Actually, the 746 has fewer filters than the 756. The marketing department managed to give the 746 one "additional" filter slot by simply removing one of the filters that come standard in the 756 - hence, an extra "free" filter slot. Clever, huh?

I don't think the 746 has dual watch receiver - I compared the two side by side before buying a 756, and don't remember a Dual watch receiver in the 746.

Also, I find the spectrum scope in the 756 very useful in contesting. Since the 746 spectrum scope does not work when you are actually listening to the signals, to me it is useless.

Jerry W4UK.

Get a copy of the ARRL product review for each radio (ARRL members only web site has them). You will see that the receiver in the 756 has better blocking dynamic range, third order IMD and third order intercept than the 746. This may not matter to you if you are in an area without strong in band signals (ie hams a few blocks away) or strong shortwave broadcasters. You will notice the difference on Field Day when you try to operate CW and SSB stations on the same band or in a multi op contest setting with KW amplifiers on adjacent bands.

> signal are within its specified accuracy?

Yes. That is what I said. Suppose you read 12.5 watts. Does that mean the power is between 0 and 25 watts. Read the scale on a 43 in good condition and you will see that this does not make sense.

> If all Bird meters were as good as yours, it would be
> foolish for Bird to specify them so loosely.

It would not be foolish at all. See explanation below.

> If "5% of full scale" doesn't mean 5% of full scale, then what does it
> mean?

It means what it says and should not be extrapolated. If the reading is 250 watts the error can be +/- 12.5 watts (0.22 dB). It does not say that a 40 watt reading is also +/- 12.5 watts. In certain applications, for best "percent" error, we would try to pick a plug-in element whose full scale coincides with the power that we are interested in.

The maximum error in watts is not a constant number at every point on the scale.

> If I measure, say, 40 watts, exactly what range of power could
> actually be going through the meter with certainty guaranteed by Bird?

As I said before, the exact accuracy at readings below full scale is not specified (there may be some formula that they use and that my inquiry to them could not determine). It is very difficult and dangerous legally to "guarantee" the accuracy at every point on the scale. My guess is that they computer-check maybe five points in the factory. I also guess that their diodes are tightly specified and hand picked (I have seen this practice also). For reasons of their own they do want to be involved with tight specs on portable instruments that may be misused or abused or operated over a wide ambient temp range (because of the tempco of the diodes).

But if you look at the scale, the markings are very well done, and the pointer is an anti-parallax type for accurate reading. I don't think this is just "window dressing." There is a certain error associated with the ability to read the meter that has to be considered. At low wattage the percent error can increase somewhat because of this. If the needle gets bent because of misuse, or if the meter has an aging effect, these things aggravate errors over time. The D'Arsonval meter does have certain systematic errors with age.

There are digital instruments that are used only in metrology laboratories such as Rock-Col that are used to check things such as 43s, which are then used at the test stations on the production line. In some applications there may be a correction chart attached to the 43.

> If they can't specify a range of values, then there is no
> specification at all. I say this as a person who has spent most of his
> career designing test equipment, all with carefully defined
> specifications, although this is very basic metrology.

I am sure that I know as much about these matters as you do. And I know exactly what 5% of full scale means, and what it does not mean.

> Out of curiosity, what was the specified accuracy of the Boonton you
> compared it with?

It was calibrated by the Rockwell Collins metrology dept. I don't know the exact number but you can be damned sure it is not off by 1.6 dB at 40 watts. Government contracts require periodic and accurate calibration of all test equipment. And the 92B is an excellent instrument that is capable of very close calibration. I use a Boonton 100:1 voltage divider for xmit measurements, and it has been verified also.

The 43 and the two elements that I bought are just a random sample of one each. Also, I am confident that Bird checks the 43 at their test stations to better tolerance than what they guarantee at the customer's site. This is common practice. The guarantee to the customer is more relaxed than their production line test. Companies have to do this to cover their butts. Tek does the same thing, I'll wager.

I also know that the 43 can be abused. I have seen plenty of that.

And if the instrument is initially much better than 5% of full scale, then over a long time, with proper usage, it will probably still be within 5% of full scale. I know that is how I would spec it.

And be sure to filter out the harmonics, amplitude ripple and other spurious.

1336. ARRL and other publications FS

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-14 00:00:00 UTC
From: Ken Simpson <W8EK@usa.net>
Message-ID: <C38R2.21$IS2.2303@monger.newsread.com>
Source record: 110920

I have the following ARRL publications for sale:

All are in good shape.

1979 ARRL Handbook - $ 12

1972 Radio Amateur's Operating Manual - 3rd edition - $ 4

1976 ARRL Ham Radio Operating Guide - first edition - $ 8

1986 Tune in the World with Ham Radio - 6th edition - $ 5

1991 Now You're Talking - First Edition - $ 8

1993 Now You're Talking - 2nd edition - $ 12

1976 Radio Amateur License Manual - 75th edition - like new $ 10

1977 Learning to Work w/ Integrated Circuits - First edition $ 6

1978 Solid State Basics - First Edition $ 8

1993 FCC Rule book - 9th edition - $ 4

1987 FCC Rule Book - 7th edition - $ 4

The ARRL Training Program - Official Novice Student Workbook
No date or edition listed, but appears about 1985 $ 3

Booklet to go with ARRL Code kit - 5 to 13 WPM - $ 2

Repeater Directories - $ 3 each
1977-78
1978-79
1979
1983-84
1987-88
1989-90
1990-91

Operating an Amateur Radio Station $ 2 each
1969 - 52nd edition
1976 - 57th edition
1978 - 58th edition
1980 - 59th edition
1984 - 62nd edition

Public Service Communication manual
no year listed - prior to 1970 for sure - appears to be first edition

$ 3
1970 - 3rd edition $ 1
1985 9th edition $ 1

1974 Ameco Radio Theory Course $ 5

I have found some older ARRL net directories. All are in good shape. Those in the 60's and 70's are $3 each, and those in the 80's are $2 each, plus shipping from Florida.

I have the following years are available:
1968-69
69-70
70-71
71-72
72-73
75-76
77-78
78-79
79-80
82-83
84-85
1989

Although not directly radio related, someone might be interested

Handbook for Patrol Leaders (Boy Scouts) - 1950 copyright - 1959 printing
$18

Exploring (Boy Scout Explorer handbook) 1958 - $ 12

1986 American Red Cross "Expect the Unexpected" $ 2

Prices do not included shipping from Florida.

Thanks.

Steve,
I would like some additional information about the Kachina Transceivers.

How old are they, are they the latest ones?
Is the one in the box still under warranty? If used, what's the
condition.

I am very interested.

Dave

I suspect it is a homebrew.

Most of the components are 1920 vintage
and are very common items. Early homebrews
typically used wood breaboards and bakelite
front panels, not metal; so there is a bit of
an anachronism here. The large
rheostat is for controlling the filament voltage
on the two tubes. The tube sockets appear
to be wafers--again a contrast to the earlier
vintage vernier dials and transformer.

The larger capacitor was probably used for
tuning. 140-pF was a "standard" tuning capacitor
value during the 30s and 40s, manufacturers
supplied coil sets for that value tuning capacitor.
The smaller variable was most likely used in series
with the tickler winding, as a throttle control, to set
the regeneration point.

If the tube sockets are 4-pin, likely tube candidates
are 30, UX199, and UX201. Blank 4-pin coil forms
are available from Ocean State Electronics. Antique
Electronic Supply I believe offers 5 and 6 pin forms.

In article <3713952D.7D0@hun.com>,
attila@hun.com wrote:
> It is FCC CFR 47 Rule 90.203 (e) which states:

While discussing the Icom U-16 and FCC type-acceptance, I
was pointed to FCC Rule 95.655 by a FCC guru.

BUT, it sure isn't clear-cut to me...

95.655 Frequency capability.

(a) No transmitter will be type accepted for use in the
CB service if it is equipped with a frequency capability
not listed in 95.625, and no transmitter will be type
accepted for use in the GMRS if it is equipped with a
frequency capability not listed in 95.621, unless such
transmitter is also type accepted for use in another
radio service for which the frequency is authorized and
for which type acceptance is also required. (Transmitters
with frequency capability for the Amateur Radio Services,
Military Affiliate Radio System and Civil Air Patrol will
not be type accepted.)

(b) All frequency determining circuitry (including
crystals) and programming controls in each CB transmitter
and in each GMRS transmitter must be internal to the
transmitter and must not be accessible from the exterior
of the transmitter operating panel or from the exterior
of the transmitter enclosure.

Let's break apart that (b) paragraph as it relates to
the U-16:

"(b) All frequency determining circuitry (including crystals)
and programming controls in each CB transmitter and in
each GMRS transmitter must be internal to the transmitter..."

Which it is in the U-16.

"...AND must not be accessible from the exterior of the
transmitter operating panel or from the exterior of the
transmitter enclosure."

First, the conjunction, "and" is used...non-type-acceptable
units must meet BOTH - not just one or the other condition.

"Not be accessible from the exterior of the operating panel"??? What does that mean? Is the "operating panel" the DTMF pad? If so, the this part of the sentence states, "must not be accessible OUTSIDE the keyboard..." - which makes the U-16 acceptable...SO FAR.

Because the U-16 is programmable by using the keypad.

The second part of that sentence: "[nor] from the exterior of the transmitter enclosure." I guess that relates to "computer programmability." What DOES it refer to?

If I take that rule literally, the U-16 is OK. But NO Motorola commercial HT that is computer-programmable could EVER be accepted/used/sold for GMRS use.

Anyone have some insight to this FCC Rule?

For Sale:

-Wilson Model St77 Self Supporting tubular tower. Rated wind area is 17 ft^2.
-Mount is four 6 foot, 1 inch threaded rods embeded (available at most
hardware stores) in a six foot concret base (instructions in manual).
-Cushcraft A3S tri-bander
-Cushcraft 30, 17, 12 meter rotatable dipole
-Hy-Gain 40 meter rotatable dipole
-Ham-4 rotator

This tower resembles the US Tower tubulars, but is much stronger. It has a
motorized winch to crank up and a manual winch with built-in gin pole for
tilting over. It's quite a rig.

The cost is $1000 for the entire rig. Firm. You supply transportation; I
can provide manpower to load on your trailer or truck.

Location is Slidell, LA, near New Orleans

Receivers compared the correct easy way!
Motorola commercial receiver test splitters.
New condition and a great time saving tool!
High quality 4 into 1, 50 ohm RF splitters.
They very well shielded cast aluminum boxes that provide a constant 50 ohm impedance match to compare
all your receivers signals at the same time.
They are small in size! about the size of three cigarette packs side to side.
I will provide new Motorola rg58 crip on connectors needed to path to your radios.
They have common connectors used in Motorola service shops.
I will sell each splitter for $29 or less if you want more than one.
I would also trade just about any ham item for a bunch of them.

Thanks for interest,

I have some Bird equipment for sale, and here is the list:

1. Bird 8201 500 watt 50 ohm dummy load in great condition W/ N
connector $275.00
2. Bird 4381 RF Power Analyst W/ N connector, no manual. Don't know
if it takes regular batteries or rechargeables. It has a charger
connection great condition, but can't test $575.00
3. Bird 4304A 25-1000 MHZ 500 wattmeter, increments of
5,15,50,150,500 scale W/N connectors great $275.00
4. Bird 43 N $150.00 good
5. Bird 43 N $150.00 good
6. Bird 43 N $125.00 scratch, and little dent on bottom
7. Bird 1000C 100--250 MHZ 1000 watts $38.00
8. Bird 1000C " " " $38.00
9. Bird 500C 100--250 MHZ 500 watts $38.00
10. Bird 500C " " " $38.00
11. Bird 250C 100-250 MHZ 250 watts $38.00
12. Bird 50C " " 50 watts $38.00
13. Bird 50C " " 50 watts $38.00

14. Bird 1K W max it looks like a element
with a BNC connector in the middle, and states on it
40 DB 125-250 MHZ $55.00

15. MA-COM nice heavy dry dummy load I would guess
about 200 watts capability model 44017 $70.00

ALL OF THIS ITEMS ARE PLUS SHIPPING

Source record: 110970

I have an ADI AR-146 mobile 2 meter xcvr. The unit is spectacular at performance. Works great, no intermod, simple to use. A bit cheap on the microphone though.

Only complaint I have is ADI's customer service and quality control. the radio was replaced under warranty due to a loose connection in the display. My local dealer wouldn't replace it, even after a week of ownership, as they could not get it to do the problem in their shop. ADIO replaced the radio, but took three weeks. Got the feeling I was dealing with a bunch of bumpkins.

In the overall, I think that their the best going for value. Wouldn't hesitate to buy another.

Mike

For a dual band amplifier check out this URL:

http://www.mirageamp.com/amplifiers/bd35.html

I got one of these amps used at a Ham swap and it works real good with my Kenwood TH-G71 HT. I also found a lenght of low loss teflon 50 ohm coax (about 2 to 3 mm OD and 36 inches long with a 90 degree male SMA connector on one end and a male BNC connector on the other) for about $4US that I use to connect the HT to the amplifier using an adapter from a female BNC to the normal SO-239 type coax socket on the amplifier.

It comes down to a matter of personal choice.. Kind of like buying a car or most anything else. We are so blessed to have all these choices.. hi.. Also depends on your cash situation.

It may be best to check with some of the local guys where you can have a look and maybe try using some of the radios. Despite the bad things that some say about the RS HTX-202 HT it is a good buy for VHF on the used market. I have one and it's not for sale. For a dual bander I have the ADI AT-600, a newer version of the RS HTX-204 which RS dropped shortly after it's first release. You can still find some HTX-204 rigs and ADI also sold it as a HT-204. It has RX from 100 mhz to 999 mhz, with key board mod (cell blocked) and full VHF/UHF TX. The price for these rigs is good. Yes you can easily expand the TX range... Mars etc.

My 2 cents worth to add to your collection.

I'm very happy with my AT-600.. preforms great and it was the best priced full featured dual band HT I could find.

Check out the ADI mail reflector at http://www.qth.net

Feel free to ask question on this mail reflector which is not too busy due to the happy customers.. Ken (not me) at ADI is a regular on the reflector where he answers questions and makes sure we are happy with the products..

The AT-600 is an upgraded version of the short lived RS HTX-204. ADI also marketed a HT-204 (still available in Canada).

Hello,

I have my 746 fitted with 1.9khz SSB on 9mhz FI and a 500Hz filter on
the 455 khz FI. I have one more slot available on the 9Mhz FI. I wonder what
filter I could add ? SSB or CW ? I'm working as much ssb as cw. Does another
cw/rtty filter will help or it will be totally useless ?

Thanks for your input,
Philippe

Depends what you are doing. Personally, I am a BIG fan of my
BCT7 Highway scanner. The repeater detection is nice, especially for
long trips. It also has CB monitoring range, whereas most scanners do
not. It's base/mobile, but kinda loses it's usefulness as a base
unit.

This should work pretty well under most conditions. In CW under contest or pileup conditions, the 9MHz IF can get overloaded with signals before they can be filtered out by the 455 filter. In this case, a 500Hz CW filter at 9 MHz will help.

Ralph,
You don't want the readings near full scale. While I was a Calibration
Tech, the method was to keep
the meter reading between 20%-80% of full scale deflection. The middle of the
scale was were the
accuracy was checked.

I have a 600 hh radio i have used it now for 1 year i have also
a yeasu ft470 and an alinco dj580
the ADI 600 is not as easy to use as the alinco dj580
the ADI 600 doesnt have the receiver that the yeasu 470 has
but i have no complaints as its been reliable and is cheaper
then the other two when they were new.
receiver of all three.Still i have no complaints about the 600
it has worked reliably with no trouble at all

I have to confess that I know more about oscilloscopes than analog meters. Tektronix scopes not only has specifications on all important parameters but the manual generally contains a verification procedure. This is a list of equipment, and complete setup instructions, for a customer to verify that the scope is meeting its specifications. Some of the larger customers routinely order this equipment at the same time they order the scope, and the scope won't get past incoming inspection unless it meets all the specs during the verification test. I was the project engineer for a 50 GHz sampling head. (I didn't design that sampler, but improved production control on the existing 40 GHz one.) We had to reduce the stated accuracy of the instrument substantially because of the uncertainty in our ability to verify it. (Even such normally mundane items as the uncertainty in connector adapter SWR added to the overall uncertainty.) I have good evidence that a large percentage of the sampling heads would actually do 60 GHz. But we were never able to assemble a system to reliably verify it. So the spec remains 50.

Some typical specifications from my 2246 manual: Step response (5-division step) Rise Time -10C to 35C: 3.5 ns or less. Vertical deflection system accuracy (includes ADD MODE and Ch 2 INVERT) 15 to 35C: Within +/- 2%. -10C to 15C and 35C to 55C: Within +/- 3%. And so forth. You've undoubtedly got manuals for Tek or HP equipment, so know how these instruments are specified.

And every specification is taken literally, by both the manufacturer and the customers. Those specifications which aren't guaranteed are plainly labeled "typical".

> The % error in any high quality analog meter degrades "gracefully" as you go downscale. The

That's nice, but "gracefully" is a pretty loose spec for serious measurement, don't you think?

> Here is the main idea. A properly designed D'Arsonval meter maintains a certain definite

> correlated to that relationship. Because of that relationship the scale can be marked with
> considerable confidence across most of the scale. At this moment I am looking at a Simpson
> catalog that specs full scale accuracy. Yet the picture shows finely spaced markings all across
> the scale. Is this some kind of "fraud"?

Absolutely not. My 260 manual states DC accuracy of 2% of full scale. On the 50 volt range, I expect the reading to be within one volt of the actual value. Period. Anywhere on the scale.

> Hogwash.

Now there's a statement that's difficult to rationally argue against.

> most of the scale within that frequency range.

"Quite accurate" isn't a specification. I wish all the customers I've designed instruments for were as easy to please as you are. My life would have been much easier! (I can see it now, "Roy's Pretty Good Scopes".)

> > I'll bet that if you were to send the

>
> It meets the requirements that Boonton says it supposed to meet.

Yet if the Bird meter were sent to the cal lab it would have to exceed
the accuracy Bird says it will meet? How do they decide which meters
have to meet spec and which have to be better than spec? Quite a cal
lab you've got there!

> And when it is adjusted at
> full scale, it is very accurate across a 13 dB range, as determined by accurate RF
attenuators.
> I have been using these meters for 30 years and I know their quality.

I wondered about the spec on the Boonton, and you say "very accurate",
and it was used to verify the Bird, which you describe as "quite
accurate". By this I infer that "very accurate" is more accurate than
"quite accurate". Perhaps we can get the meter manufacturers to
standardize these terms for those of us more used to working with
numbers. Your cal lab obviously knows how to translate them.

> As for going separate ways, go which ever way you like. If that is the way you want to
behave

FORSALE - MINT Icom 735 HF rig

I have an absolutely mint condition (still has the
protectice plastic over the slide swithces!) Icom 735 HF rig that
I'd like to sell. The rig includes the optional 500-Hz
CW filter and the original hand mike with up/down controls. I bought
the rig as a "backup" and have never used it (other then to test it
out for about 1 hour). It's like new.

ICOM 735/cw filter/mic $575.

I aquired a Kenwood TR7950 with no manual in a trade. I don't seem to
be able to change freq using the keypad. I also need to set a tone
freq and pressing "TONE" sets up a screen that looks promising, but
nothing can be input via any of the controls. Can anyone tell me how
to operate the keypad controls to set up subaudible tones?
Maybe there is no tone module or the tone is just a tone burst type?

Thanks, Ken K5MBV

Two comments:
1) It is no longer legal to unblock cellular frequencies, thanks to a recent FCC ruling.
2) Since the owner Terry Sturman passed away last weekend, it's quite possible that all AES stores were closed the day of his funeral.

I used to own one of those units, and if memory serves, there was an optional module that allowed you to chose one of three different tones to place in memory If it is not responding to the input keys, it may be missing the optional tone module. I will check and see if I still have the manual laying around and if so I will contact you and send it. If I can find it, I have no need for it.

1377. RF into speaker leads

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-15 00:00:00 UTC
From: jsutton@erols.com
Message-ID: <37163265.7754216@news.erols.com>
Source record: 110795

I am just having a look at PSK31 - a new digital system described in this months QST. It is indeed something to behold - I expect it to replace RTTY and other digital modes before long.

However I have a problem - when my xmtr is on there is pick up by the speaker leads. The input to the speakers is 10K ohms - since the speakers have amplifiers to increase the audio level out of the sound card.

Question - although I have seen information in the past - I don't remember what specific ferites would be useful to eliminate this problem. I assume Radio Shack has some and they can be ordered others.

Your thoughts will be appreciated.

Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment,rec.radio.amateur.boatanchors

Hi,
I picked up an EF Johnson UHF radio (Fleetcom 2) that has been converted to a repeater. I need tuneup info to get the thing on the UHF ham band. I have searched with no luck on the web, and still come up empty. Need to presumably align the transmitter and the receiver (along with the helical front end).

The conversion appears to be a home brew job -- little circuit boards inside apparently cover "time out" timer, COR, and audio mixing. No idea how to interface a controller to this, as I can't seem to find the COR line.

I need:

1. Any info on the Fleetcom 2, especially service / tuneup info
2. Looking for UHF crystals 440.925 (TX) 445.925 (RX) if you have any or if you know the "details" for ordering rocks for this unit.
3. Any info on converting to repeater use....maybe, just maybe, this was a common mod and info is out there on "how to".

I am willing to pay for this info.
thanks,
Joe K7JOE

1379. ***FS: Icom IC-Q7ABC 2m/70cm HT with NiCDs $160***

I have a three day old! Icom IC-Q7ABC Dual band micro HT for sale.
It is only 3 days old, with all paperwork, box, manual and warranty card.
The warranty can be transfered as I will send the reciept with the HT. It
is a GREAT excellent little ht, I used it more as a scanner than an HT. It
has VERY loud audio out, and GREAT TX audio! 100mW audio power out! The
thing is the power out put is rather low for my use. Here are the specs:

RX:
30MHz-1300MHz*

Sensitivity (all measurements in micro volts)

FM: (at 12 dB SINAD)
30-117.995MHz 0.32
118-174.995MHz 0.16
175-246.995MHz 0.22
247-329.995MHz 0.4
330-379.995MHz 0.32
380-469.995MHz 0.18
470-749.995MHz 1.0
750-999.995MHz 0.32
1000-1199.995MHz 0.79
1200-1300MHz 0.5
WFM: (at 12 dB SINAD)
76-108.0MHz 1.0
175-221.995MHz 1.0
470-770MHz 5.6
AM: (at 10 dB S/N)
118-136.0MHz 0.56
222-246.995MHz 0.79
247-329.995MHz 1.4

TX:
144MHz-148MHz
430MHz-450MHz

* These freqs are continuous minus the standard cell freqs.
blocked here in the US. The sensitivity on this HT is GREAT! I listen to
quite a few 1.25meter (224MHz) repeaters and also mostly public service
from 300MHz and up and this HT out performs my handheld scanner! It is
very good to listen with, and can transmitt also. It can recieve over 4
HAM bands.... 6 meters, 2 meters, 1.25 meters, 70cm, 33cm.... It also
recieves those wanted freqs. around 46MHz... ummm, you know like FEMA, and
other Emergency mangament use! :> (Oh did I mention that cordless phones
are here too!) It can go down below 30MHz I have been told by using

the software for it. I have the software, but it is freeware, I do not have a cable for it though. Cell images might be found around 490-520MHz if you try. :> I have the Icom batteries (2 AA Nicds) and the charger that goes with them also. They are included. This is a GREAT deal. If you want more info etc.... then E-Mail me and I'll get back to you as soon as I can. I can consider trades also. All for only $160 shipped to your door, and insured!!!

1380. Help! FT51R ht locked in Euro mode??

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-15 00:00:00 UTC
From: "F. Feeney" <fkf1@cornell.edu>
Message-ID: <7f5ec2$fg8@newsstand.cit.cornell.edu>
Source record: 110798

Hi,

I need some help with my FT51R yaesu HT. It was on the bed the other day where I'd been listening to it while dozing off, and when I got up I rolled over on it. No big deal, it's a waterbed so you can't really squish anything too hard - but I did mash down a couple of buttons, and the aftermarket "doesn't fit exactly right" battey pack must have wiggled so it had the equivalent of a power on reset with some unknown combination of buttons pressed. It emitted a couple of indignant squawks and came up reading 144.00 and 433.000 and MSG ID showing. Obviously reset.

I started to load back in my repeater freqs, and it wouldn't let me tune above 146. Tunes 144-145.995, but rolls back to 144 if you try to go higher. Hmmmm. So I looked up some old mod info, and did the MR+VFO+2 power on reset, same results. Then I tried the UP and DOWN arrows power on reset, and it will let me receive up in the 146 range now, but still won't transmit outside the 2 mhz wide window. I'm presuming it's flipped into some european or asian mode - now I need to know how to make it back into an amercian bandplan radio.

I did the obvious and called Yaesu and got some mumbling about how you must have zorched the CPU, you'll have to send it back in. I suppose it's possible that the CPU got spiked, but it doesn't seem likely. This battery pack has been on this radio for a while and does have some intermittant connection, so it's not the first time the radio has seen 4.8 volts come and go abruptly. Where's the spike supposed to come from? I mean disconnecting or connecting the battery isn't any different from flipping a power switch (although I guess this radio has a software power switch....hmmm).

I'm presuming the radio has some other real hard reset - disconnecting a lithium backup battery or some such, or maybe a hidden hard reset switch. Does anyone know? I hate to pack up the radio and send it off for something I can probably do here if I just knew where to poke. I'm not afraid to go inside the rig to work on it, it's already had the extended coverage mod done and some repairs on the bnc connection, I've worked on it before.

I was sort of disappointed in the yaesu tech support guy - he didn't seem very knowledgeble - sounded like he was reading off a screen with only two choices, reset and fix or else return for repair. I'd like a third choice.

Can anyone help?

Thanks in advance

Kevin, WB2EMS

Hard reset for the FT-51: Take it apart to the point where you have a
clear view of the little lithium backup battery BT001. Above and to
the right of it, there should be a little solder jumper labelled JP1008.
It's almost between the two battery leads. Remove the solder. This
interrupts battery power to the CPU. Leave for several minutes, then
add a new blob of solder. The CPU should be reset.

This clears all user-programmable things, like a soft reset. The manual
does *not* say whether it also clears all of the radio calibration
adjustments. The radio uses settings stored in memory to adjust many
of its operating parameters instead of pots: things like deviation,
squelch thresholds, S-meter scaling. So these *might* be lost. It
requires a service monitor or equivalent to reset these.

I have a 10m to 2m transverter board that provides
5-10mw linear (all-mode) output on 2m.

I am looking for a kit, module, or adapted rf strip that
will get me 10-30 watts output (all-mode) from the
transverter's 5-10mw drive (more power is better than
less since this will often be driving a 170w 2m amp that
likes 20-30 watts of drive for full output, but price is an
object as well).

BTW: I am not in a position to build a circuit up from scratch
at the moment, but I can handle a kit.

Thanks for suggestions, offers, and/or referrals.

It is my understanding that you cannot transmit with the wall wart
simply because it only delivers about 500ma, you need about 2a
for transmit. If you hooked it up to 'real' power supply you would
not have that problem. Haven't actually tried this myself yet.

> accuracy was checked.

That does make some sense. The top end of the scale is quite crowded and the 20% to 80% has much better resolution. Below 20% the diodes can effect the readings at high/low ambient temps.

But if you look carefully, the top end can be read accurately, although it requires more effort. The Bird 43 is well marked and readable.

The big fallacy here is that if a meter is specified 5% at full scale (all meter mfrs do this) that it is somehow worthless any where below full scale because it is not officially specified everywhere. This is contrary to the common knowledge of those who are knowledgeable about D'Arsonval meters.

The correct viewpoint is that a 2% full scale spec (very common) is, believe it or not, a measure of the quality of the meter across the rest of the scale. It is not true that the rest of the scale can be "anything".

A meter that is accurate at zero and full scale, but highly inaccurate elsewhere is not a *reliable* meter *anywhere*. It is poorly designed.

The "art" of meter design is to get a movement that is as reproducible as possible. This movement cannot have gross systematic errors because that would make that goal impossible.

If you download and use Goran Vlaski's FT50 Manager software, you can set your radio to whatever mode you want! I have tried it with mine and it works just fine. Do read the instructions, it makes life much easier.

Check out: http://www.rfparts.com/
Look under RF power modules. There are mitsubishi parts
(probably others as well) which will run 30-40 wats out -
class AB. To get as much gain as you need, you may well
need to use two modules. One low power, followed by the
high power module. These modules are typically 50 ohms
in/out and require only a few bypass caps and ferrite chokes
to implement.

If you are NOT double boxing the rig, then you are asking for trouble... I have shipped RX-1's and NC-300 from Canada to the U.S. Old Heavy Tube testers to Japan and hundreds of other items... the secret to "Proper" packing is to eliminate internal inertia within the package... Popcorn will work fine if it is packed dense enough to act as a shock absorber... I usually completely Bubble wrap the rig, in BOTH directions using 12" wide 1/2" Bubble wrap... If you wish to protect the VFO shaft/knob etc, tape the roll end of your packing tape on top of the bubble wrap, so it and the wrap will take the brunt of the force of an impact... you can also remove the VFO Knob, This should all be Inserted into a strong INNER box, that is a tight fit... mark the top and front of this box with a T and an F respectively... this will come in handy later... then using a tall box, place 2 thicknesses of cardbboard and then at least 2" of Hard S Peanuts... then place the Inner box end down into the larger box... align it so that you have a little more room for the front than the rear, and more room for the bottom than the top... the pour more Hard S Peanuts to fill the package... then using more boxes, insert broken-down packing boxes on all 4 sides... recheck the peanut fill for hardness... now you see why marking the top and front are important... then fill the top of the Packing box with Peanuts and a double layer of Cardboard... seal the box and label it so that the label is on the top or the FRONT side of the rig... mark on your label for the front " DO NOT Lay on This Side" UPS always packs the parcels so that they can read the destination without having to move the package... use arrows to indicate that it goes end up... YES END UP!!!! if you have a delicate Plastic Dial drun ala the TX-1, RX-1 etc nothing will break it like having it thrown on the floor of the truck/warehouse etc, than if it is packaged bottom side down... but if the force is toward the end of the drum, its chances of survival is MUCH improved... also this method of packing will not allow feet etc to push through the package... some GIVE is a must , and using solid sheet simply transfers the forces directly to the rig and or internal packaging box... which is NOT what we want....Your package will end up spending most of its time occupying the least floor space during its trip, which means it will go end up anyway... this way you can pack the item specifically for this type of shipping... and if the label/ Packing list /customs forms are on the front panel side, you can be sure they will be shipped so that this side is always visible...and will not find it's way to be the bottom of the

shipment... this has worked VERY well for me, and I have not had any complaints of item or component breakage... be sure you place the heaviest side of the unit on the bottom end... this makes it very hard to tip over, and will force the carriers to lift and place the unit down with a little more care than if it were heavier on one side or the other... Try to anticipate the actions of the handlers, and your work becomes quite clear... just my 32.00 per bags worth... 73 de Jordan...

Yes it is by definition of what an accuracy statement referenced to
full-scale is. Read ANY elementary book on instrumentation.

>High quality meters of all types routinely specify full
>scale accuracy. Because of quality control of the relationship between
>"deflection" and "input" they can mark the scale with considerable
>confidence. The accuracy degrades "gracefully" below full scale.

What you refer to here is a different accuracy statement. This implies
accuracy as a percent of reading. This was not what was specified.

As I stated yesterday, precision instruments usually give an accuracy
statement including both percent of reading and percent of full-scale.
Percent of reading accuracy is easy to measure with a linear scale, but
much more difficult with a nonlinear scale. With nonlinear instruments,
you are concerned with two things - how well the scale calibration fits the
instrument response curve, and how well the curve represents reality. The
Bird accuracy statement tells you only that the one reading, that taken at
the full-scale reading of the dial, is within 5% of the actual value. It
tells
you nothing of how well the dial calibration fits the actual instrument
response.

In the instrumentation industry, manufacturers routinely go through the
game of "specmanship". I would much rather have an instrument with an
accuracy of 1% of reading plus 20% of full scale than I would one with 5%
of reading and 5% of full scale. In the first case, I can do one
calibration at the full-scale value and then make any measurement to within
1%. In the second, all measurements are no better than 5%. And when a
manufacturer gives only the full scale accuracy for a nonlinear
measurement, you have no actual idea of the real accuracy at lower scale.
It likely is not as bad as only the full-scale accuracy suggests, but the
only guarantee from the manufacturer is the one point.

>I definitely do not agree with your comments on this. They are contrary to
>my experience with high quality laboratory analog meters of many types.

Please go back and consult the actual accuracy specifications on these meters. The better ones will state accuracy as a percent of reading. The excellent ones will give you a full set of statistics.

Hello
I have a Icom 740 that I need help with trouble shooting. The rig
lights up fine in moble and with built in power supply. All the relays
appear to be working fine. In other words all the mechanics of the radio
work fine. The problem with the rig is there is no transmit nor receive.
I mean no even a little bit. I can key down a radio next to the Icom 740
and no receive, no meter movment nothing. The same thing with the radio
in the transmit mode all the relays work but no signal not even a
millwatt of output. When the rig is put in the FM mode I can hear the
white noise come out of the radio but there again no receive or
transmit. Does anyone have any idea which board I should look at?
Thanks for reading
73 from Oris

Regardless of the arguments I've just read on calibration and how it is
suppose to work, the meter can still be way out in left field. You can

easily
damage a bird 43 slug by whats called over rangeing the slug. That's where you have a slug in the meter of lets say 50 watts and you fire up a radio or amplifier
into the meter that has an output of say 150 watts, this can damage the accuracy
of the slug. I used to work in a ham store and we never took these in on trade
without checking the slugs against one that was known to be accurate. Believe
me when I say I saw slugs that were way out in left field when it came to accuracy.

M Johnson (silversq@ix.netcom.com) hath said:
: It can be frustrating to try to judge a radios performance from comment on the
: newsgroups. When someone has a radio that is working fine they don't need to
: post anything about it. So most posts you see tend to be about problems they
: are having.

Which is exactly why I'm asking :) I don't want to go by only two
comments I saw, but before I even saw them I had already intended
to buy an FT8100, after reading about it I thought twice and decided
to ask others... Someone suggested I get the TM-G707 even though it
is dual-band, it only lets you listen to one side at a time, and I
DON'T WANT THAT! I want V+V U+U V+U capability. hehehe. I've had
some good response from my message thus far, and i feel confident
that Yaesu has put out agood peice of equipment..

Thanks for the response.. Jimmy, KB5FSV

I am looking for an ELF/ULF reciever (ie- 0Hz to 150kHz or as low as possible) either a complete unit or a schematic with ariel design.
Also can anyone recomend the best ariel to try and use on a reciever designed for around 20kHz. I am a bit of a newbe so I dont want to waste a lot of time on the wrong thing!
Any help is much appreciated!

Make sure, when considering this linear that you watch out for several
issues.

1) There were two major versions. The 4 button and the 3 button. The
4 button is later production and is superior.

2) The amp had extreme problems with overload on SSB. Kenwood radios
would cause the protection light to go on immediately upon speaking
into the microphone on SSB. You'd have to flip the power on-and-off
in order to continue.

3) Yaesu has a modification (I think you have to pay for it) to
partially fix the overload problem. This allows operation with newer
Yaesu transceivers (the 1000MP for example). Without the mod, alas,
the 1000MP also overloads the ALC of the amp.

All-in-all, it's a pretty shabby linear (600 W output max). You're
better off with a good tube linear (Kenwood, Drake etc.) I'd avoid
the FL-7000 unless you have an older solid-state Yaesu rig (the 890
works OK with it).

Hi Guys;
Lack of funds has caused me to put these "gems" up for sale.
I believe these prices are very fair for the condition that they are in. Please read on!
(1)-AS NEW Icom IC-T8A Tri-Band H/T, 6, 2, 70cm. In original box with every thing that came with it, besides another NiMH battery. You get two batteries, one a 6.0vdc@700mah = 2 watts out.
The second is a 9.6 @ 680mah = 4.5 watts out
All for $250ppd and insured.

(2)AS NEW ALINCO DJ-C5T Dual-Band H/T. Looks like a wallet calculator, 300 milliwatts out, tones, Built-in Lithium Ion battery, charger, case Everything that it comes with in the case. Made in Japan. Price is $150ppd Conus!

(3)KENWOOD TH-22AT 2 meter H/T, original box, manuals, charger, et al! Works perfect, looks New. 40 memories, 3 watts on high, .5 on medium, 30milliwatts on low. Only blem is where I has a decal on the back and caused a blem on removal. It touched it up, good enough. Price is $140 ppd! This is not oone of those chinese H/T's selling for $2.00. This is A Kenwood!

Boy did I screw up. I had just built a connector to hook up my IC-735 to my sound card to do PSK31. (Cable was okay, no shorts, used stereo plugs-left channel+ground) I plugged it into the ACC jack of the radio and then commenced to plug it into the Line-IN and Output jacks. As I was plugging it in the rig went completely dead. I think it happened while plugging in the AF plug. What did I blow? It wasn't the fuses in the power cord.

Any ideas?

There is an internal fuse in the power amplifier heatsink. You will
have to remove the top cover and then open the power amp. Go at it
like you were going to install the EX-243 keyer but continue to open
the actual bottom panel of the power amp. You will see the fuse
inside. My guess is somehow you might have a whisker touching Pin 7
of the ACC plug and one of the audio in or out connections.

Greetings,
I have a Shure 102C microphone that I would like to trade for a Tigertronics BP2M packet modem. The microphone is in very good physical condition. However, I cannot verify the carbon element. The inside is very clean, and I am almost positive there is not any corrosion on it. I have the orginal box and instructions for the mic. I bought it thinking I would use it on an older radio, but I decided to get a new solid state rig instead. The connector ends of the mic were stripped by the previous owner. The fabric protecting the element looks new and has no dust on it.

If you are interested, please let me know and we can discuss terms.

I would also be willing to trade it for a Heil footswitch.

FS 2 Swan 270B xcvrs
#1 is VGC a minor scuff on face and all good tubes. Works on all bands. Original knobs with aluminum brights. Looks about 8+ out of 10. With copy on manual.
Asking $155 plus shipping

#2 is in fair condition, face is good. Cabinet is fair. Radio plays but needs a little help. With copy of manual. About 6 out of ten.
Asking $95 plus shipping.

All reasonable offers considered, cash or trade.
Looking for Zenith Transoceanics or any Drake receivers.

Thanks

Butch

Kenwood PS-53 heavy-duty 20-amp supply in mint condition cosmetically and electronically. This is the supply designed and sold for TS-450, TS-690, TS-570, but will power any transceiver in the 100w-output range. Sells new from AES today for $250; used for $180. This one looks and works like new and has seen very little use. Manual included. $145 + shipping.

ALSO Kenwood PS-30 heavy-duty 20-amp supply in excellent condition. This is the supply designed and sold for TS-120, TS-130, TS-180, but will power any Kenwood transceiver in the 100w-output range. Sells used for $145. This one looks great and works perfectly. Manual included. $115 + shipping.

Hi,
Never thought I'd join the big leagues and actually own one of these,
but what the heck. I'm interested in finding a service monitor for
general ham radio use -- should cover 1 Mhz up to about 500 Mhz.
Should have sig generator, freq counter, scope and maybe spectrum
analyzer. Not sure what else I need, but seems every project I tackle
is more complicated than a simple volt/ohm meter. This does it all,
right? So -- guess this is what I need. Used OK. What can I get
and how much should I be prepared to spend?

Want to do things like: tune up cavities (duplexers)
tune up radio receivers
(selectivity/sensitivity)
tune up transmitters, ensure they are clean
ensure on-frequency, proper deviation, proper
sub audible tone deviation.
measure power out, VSWR, etc....

So, looking for thoughts and input.
thanks,
Joe

Yes, I don't like that I bought a new Yaesu that was defective and got the old AES/Yaesu runaround that many others have reported on the FT-100 and FT-847 boards as well as contesting.com.

However, Yaesu and ARRL really are Siamese twins. Same law firm, ARRL approves the DXpeditions Yaesu equips, and Yaesu backs up ARRL in its FCC dealings (see the new scanner NPRM- Kenwood didn't comment until the replies, I believe, so someone at ARRL brought Yaesu into it at first).

ARRL "held over" by "popular demand" the review of the FT-100 on its site. What BS ! ARRL feels sorry for Yaesu that it took them 4 years to play catch up with Icom. Please, the FT100 has come through defective for many, many people and don't give me that all new rigs line... the FT-1000 MP crowd is still bitching 3 years later.

Icom and Kenwood ought to tell ARRL where to stick their ads based on this sort of preferential treatment....

Check out the auctions on www.ebay.com under the electronics test equipment area. You can sometimes find used ones at hamfests. I got a nice Singer that covers from '0' to 500 mhz at a hamfest for about $ 150 as the guy did not want to carry it back home. It only has the FM module in it, but the signal gen can either be modulated or not.

If all else fails, you can get a new one such as an IFR brand for around 5 to 10 thousand depending on the modle. hi hi. Some of the IFR series have a built in dummy load to 150 watts and wattmeter and a spectrum analizer good for up to about a 10 mhz spread.

If you are tuning a duplexer, you might need to get two of the cheaper ones.

Which of my statements was wrong?

I hope no one thinks I'm claiming that no individual Bird wattmeter can measure more accurately than its specification. (In fact, I'm quite sure that all of them do. And in many cases, an individual meter with an individual slug might commonly be a great deal better.) All I've said is that the Bird accuracy specification of 5% of full scale means that they guarantee that the reading will be within 5% of full scale. With a 250 watt slug, this means +/- 12.5 watts. They don't have different specifications for different parts of the scale, so it applies to a reading anywhere on the scale. If they stated the spec as "5% of full scale at full scale" with no more information, then the only reading they'd be guaranteeing is full scale, with no guarantee of accuracy anywhere else on the meter. If they specified "5% of reading", the guarantee would be, for a 250 watt slug, 12.5 watts at full scale, 6.25 watts at the 125 watt level, and so forth. But neither of these is what the specification says.

If this is what you disagree with, there's nothing more I can really add to the discussion. Either you take specifications literally, as I do, or interpret them in some other way as Bill does. If I made some other statement that you believe was wrong, I'll be glad to listen to your reasons for thinking so.

I keep a 3M postit on my monitor with emails and call letters of internet
people who have been less than honest with various dealings.
In short, the 'shit list'.
The newest member is Chuck Olive N6HKF.
Earlier this week, he posted several items for sale. I was 'on-line' at the
time and replied right away that I would take it, so I thought I would have
a fair chance at being the first respondent. This was in the evening.
Sure enough, I got a message back the next morning that I was the first to
reply and to send my address for calculating shipping. I sent off my
address,
and checked again that night for the full amount. Nothing. I checked the
next
morning and still nothing. I then sent a message asking if he got my
address.
That night I got a message "sorry, the unit is sold"
I replied reminding him that he sold it to me. He said he waited, and just
thought
I lost interest. Oh, he said he did get my message with an indication that
it went through 3 retries or something like that.
Anyway, clearly something else went on. If I was selling something and sold
it and was waiting for the address, I would surely send a message after 2
days
or so saying I didn't get your address, did you send it??
So, my advice would be to keep track of jokers like this, Perhaps with a
little stick on note like I do so you can avoid them in the future.
Good luck all !

DFC-230 is simular to VFO-230. Basically the DFC-230 is a repackaged
VFO-230. I had a DFC-230 and do not think there was a schematic with the
manual. The VFO-230 schematic and alignment info is with the TS-830
service manual.

J Kelly (jk108@mydejanews.com) hath said:
: I got my FT-8100 at Christmas time, and so far, I love it. I replaced
: a Kenwood 732 and will never buy another Kenwood product again.

Well I still love kenwoods :) But their dualbander should of been
more thought out before they put it on the market, or atleast gave
a optional display control head, I would of bought one. I'm pretty
set on getting the FT8100 now though..

I'm trying to find out what reception ranges it has though, how wide
is the receiver on both the V side and U side. With the kenwood I
am limited to 118-174 on V and 420-470 on U. Yaesu is known for its
wide ranges, I have the VX1R and like its wide range of frequencies.

Greetings All,

I am a lttile short on cash so I would like to swap a Near Mint Condition Yaesu FT-2500M VHF Mobile two meter transceiver. This thing has never been installed in a vehicle and has all the bells and whistles included, CTCSS, DTMF, Tone Paging, Forwarding, 5/25/50 Watts out, 9600 baud compatible, Microphone, cables and manual. Perfect radio. Military Grade construction, a rugged, hi quality rig.

In return I am looking for a Drake R4-C, It will complement my TX-4XC, it should be in good working order and attractive. (No Major dings or Flaws).

message here or email me if interested.

1478. Opinions wanted for dualband mobile

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-16 00:00:00 UTC
From: cepler@Stormhaven.org
Message-ID: <7f6hpibbe1@esinet2.esinet.net>
Source record: 110737

It's been a while since I've been active in amateur radio (4 yrs or so) and I'm looking at purchasing a new mobile rig.

I've been struggling with the choices and have pretty much narrowed it down to:

Icom 2710H
Kenwood TM-V7A
Yaesu FT-8100R (Or an 8500 if I can find one perhaps)

I'd appreciate any opinions you may have about these radios. I really like the Kenwood's features, but I'm worried about the lack of a mute function as well as the reported intermod problems. Does the AIP work well to eliminate the intermod w/o affecting sensitivity much?

Next choice would be the Yaesu but here I'm a little worried about quality control, lack of alpha numeric display and lack of features including the remote control capability on the Kenwood. The microphone in the head unit shouldn't be too much of a hassle for where I intend to place the unit (Above the center vents on the dash with Velcro.

The Icom I don't know a whole lot about. I'd like to know whether it can be controlled remotely like the Kenwood. It lacks the alpha display and it's controls look a bit more complex on the head unit. Don't have any idea on how this one will cope with intermod.

My previous radio was a Kenwood TM-742 with 2m/220/440. It worked pretty well, but it did develop a problem I believe with the finals..just wasn't putting out.

Your feedback will be greatly appreciated. I'm tempted to just hold off and wait for some new radios to come out 1) to let the prices drop and 2) see whats new and interesting. The Icom 2800 is coming out...altho, I'm sure that thing will be QUITE expensive with that large display.. ;) And I was told by a fellow at HRO that Yaesu is coming out with a new radio shortly and that I may want to wait to see how it affects the 8100 pricing...

Please E-Mail copies as well if possible, thanks!

Ok... this it it, the big one. it's an original, four year old, ETO model Alpha 87A.

I'm moving to Florida and selling a lot of stuff. This tops the list. In the box, like new condition. Never a contest. I have used it for ragchewing on 75 and 160 meters. I suspect it has about 200 hours of talk time on it. Never used for CW, RTT/y or FM.

This amp is just loafing at 1500 watts on sideband. This is the one ETO tried to destroy with a "brick on the key" for a year at full legal limit.

If you are serious, it could be yours for $4,500. I guarentee.

Itï¿½s correct : if AGC is OFF, s-meter deflection depends, not of the
received signal, but of the setting of the RF GAIN control.

1494. Re: HOW TO: Calibrate SWR/Watt meters

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-16 00:00:00 UTC
From: "William E. Sabin" <sabinw@mwci.net>
Message-ID: <3717322A.25148D5A@mwci.net>
Source record: 110753
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.equipment,alt.ham-radio.mods,rec.radio.amateur.boatanchors

I took some data on two 2 inch panel meters that I bought in 1946, 53 years ago. For 10 years they were in a CW transmitter, needles flopping around at 25 WPM. A Beckman 310 with accuracy of 0.75% +/- 1 digit was the reference. Both meters are rated nominal 3% of full scale.

Meter number 1: 0 to 50 mA:
Reading Actual % error
50 48.5 3.0%
40 39.1 2.3%
30 29.1 3.0%
20 19.7 1.5%
10 9.5 5.0%
5 4.0 20%

Meter number 2: 0 to 200 mA:
200 198 1.0%
150 149 0.7%
100 102 2.0%
50 51.5 3.0%
25 26.1 4.2%

So much for the intuition that a panel meter that is specified only at full scale cannot be trusted in regions above, say 20% of full scale.

Add a Plectron or Motorola Alert
Desktop Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.]

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their crystal controlled, transistor Plectron and Motorola desktop monitor receivers. They have now been replaced by battery operated portable pagers, and the desktop models are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. They are desktop models which can be powered from 117VAC or 12VDC with the proper mobile cord. The audio quality of a Plectron P1, Plectron 700 series, and Motorola Alert Monitor is far better than any consumer grade scanner and the sensitivity, image rejection, and intermod immunity is outstanding when aligned properly.

Models and Frequency Coverage

The Plectron and Motorola Alert monitors are single band receivers: VHF-low, VHF-high, or UHF. No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz

band, so there were versions optimized for each portion of the VHF-low band. There were different versions to cover low and high "splits" in the VHF-high band, too. For example, low band R8000s come in 30 - 35, 35 - 39, 39 - 49, and 49 - 54 MHz versions. There are two VHF high band versions of the 700 and R8000: 148 - 158 and 158 - 175 MHz.

VHF-low band Motorola Alert monitors come in two splits: 30 - 42 and 42 - 54 MHz.

Although UHF versions of the 700 series were made, they are somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different options. Both the original P1 and later 700 series are suitable for restoration, although I prefer the newer 700 models. The 8000 series were even newer and very desireable, but they are difficult to find at hamfests. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

_____
25-54 R19 R15 R17
148-174 R20 R16 R18
450-470 R23 R21 R22

Table 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

Table 2. Plectron 700 models

The R8000 series are much smaller than the P1 and R700 and are housed in metal cabinets of various colors. The R8000s use the same MC3357 IF/detector/squelch IC used in crystal

scanners, but their crystals are not interchangeable with ordinary scanners. R8000s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

30-54 R8190 R8150
148-174 R8200 R8160

Table 3. Plectron 8000 models

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built in cassette tape recorder. The recorder is carrier activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

The tape recorder inside the Receiver/Recorder employs two rubber belts. The Projector Recorder Belt Company makes replacement belts which work fine, though they may not be the original equipment:

1. PRB SCA8.6 (218 mm)
2. PRB SCQ 2.5 (64 mm)

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them.

Crystals

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

The best source for crystals is:

International Crystal Mfg Co.
11 N. Lee Ave
Oklahoma City, OK 73102
tel. 405-236-3741, 800-725-1426

You need not bother with calculating the crystal fundamental frequency. Merely supply International with the exact receiver model number, printed on the rear label, and the frequency you want to monitor. They will perform the necessary calculations.

Crystals for Plectrons

The Plectron P1 series contain two crystals. The second local oscillator crystal is 11.155 MHz regardless of band. On VHF high band (148 - 175 MHz), the P1 series employ this formula for the first local oscillator crystal:

Crystal frequency (MHz)
= (station freq (MHz) + 10.7) / 4

or

Crystal frequency (MHz)
= (station freq (MHz) - 10.7) / 4

On VHF low band (25 - 54 MHz), the P1 series employ this formula for the first local oscillator crystal:

Crystal frequency (MHz) = (station freq (MHz) + 10.7)

or

Crystal frequency (MHz) = (station freq (MHz) - 10.7)

There are two crystals (Y1, Y2) used in the Plectron R700 series, one for each local oscillator. The crystal formulas are:

RF Range (MHz) Y1 (MHz) Y2 (MHz)
_____
25-29 (f+10.7)/3 11.155
29-32.6 (f+10.7)/3 11.155
32.5-35 (f-10.7)/2 10.245
35-41 (f-10.7)/2 11.155
41-47 (f-10.7)/2 11.155 (use 10.245 MHz
for Y2 on 44.62 MHz)
47-54 (f-10.7)/3 11.155
148-158 (f-10.7)/9 11.155
158-175 (f-10.7)/9 10.245
450-470 (f-10.7)/18 11.155

The economy Plectron 500 series use this scheme for the first local oscillator crystal:

RF Range (MHz) Crystal (MHz)

---

25 - 35 (f+10.7)
35 - 54 (f-10.7)
148 - 174 (f-10.7)/4

Most Plectron 500s use an 11.155 MHz second local oscillator crystal. However, a 10.245 MHz crystal is used instead for receivers in these ranges: 33.4 - 33.78, 44.62, and 158.78 - 158.82 MHz.

Power Cords

AC power cords for both types of receivers use unique connectors and are scarce. I published the pinout for both Plectron and Motorola Alert Monitor receivers in June 1998 Monitoring Times magazine.

You can buy the proper replacement power cords but it's much cheaper to drill a hole on the rear panel and solder on a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

Squelch and Minimum Volume Setting

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Both Plectron and Motorola Alert monitor receivers are designed purposely to have a minimum volume setting which is still audible. The intent was to prevent firemen from turning the volume down completely, forgetting it was down, then missing an important call.

This "feature" was usually implemented by having a fixed value resistor in series between one end of the volume control and ground. In the R15X5, R14X5, R15X5, and R16X5, a 47 ohm resistor, designated R624, was inserted in series with the violet wire leading from the volume control.

You could decrease the lowest volume setting by decreasing the value of this fixed resistor. Alternatively, you could replace the resistor with a jumper wire to completely

silence the receiver at minimum setting of the volume control.

Tone Alert Feature

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain.

Repair and Replacement Parts

Repair service and replacement parts for the Plectron P1 and R700 models is offered by:

Weber Electronics
PO Box 212
5138 Laurel Ln.
Broad Run, VA 20137
telephone (540) 347-7760
email: weber@citizen.infi.net

You can also obtain Plectron repairs and parts from:

Northeast Communications
4 Oak Ridge Rd
Newfoundland NJ 07435
201-697-8804

Alert Monitor parts are available from Motorola. Phone (800)972-3226.

Plectron SM-series Scanning Receivers

Plectron also sold an SM series of scanners, manufactured in Japan by the same folks who made Craig (division of Pioneer) scanners. The SM series are consumer-grade models and are included in this article for the sake of completeness. They are crystal controlled radios and feature priority scan and a separate trimmer capacitor for each channel to net the crystals on frequency.

Band Frequency Limits

VHF-low 30 - 50
VHF-high 150 - 174
UHF 450 - 470 MHz

Table 4. Plectron SM Model Band Limits

Model UHF VHF-high VHF-low

SM-301 X X X
SM-302 X X

SM-303 X X
SM-304 X X

Table 5. Plectron SM Models

The crystals used in the SM series are quite different from
the crystals used in the conventional single channel
Plectron monitors. Here are the crystal formulas:

VHF low band:
crystal 3rd overtone freq = receive freq + 10.7 MHz

VHF high band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz)/3

UHF band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz) /
10

Other crystal specifications for the SM series are:

CR 25/U holder
3rd overtone
20 pF load capacitance
parallel resonant
max series resistance 40 ohm
max drive 2 mW

Plectron Alternatives

Too bad Plectron is out of business. If you wish to
purchase a new receiver with "Plectron-like" signaling
capabilities, contact Reach Electronics:

Reach Electronics
1311 West Pacific
Lexington, NE 68850
(308) 324-6661
(800) 445-0007
FAX: (308) 324-4985

Reach sells tone & voice pagers, Alert monitors, and
ENCODERS. They also do contract manufacturing.

I currently have no Plectrons or Motorola Alert Monitors
for sale. I'm hoarding them. :-)

1506. RX-320 Free Beta Software

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-16 00:00:00 UTC
From: mktg@ix.netcom.com
Message-ID: <37356ade.13374030@nntp.ix.netcom.com>
Source record: 110765

April 16, 1999

Dear RX-320 User,

Beta version D of the Flexi-Tuner software for operating the Ten-Tec RX-320 is now available.

Many thanks to the many beta testers for their excellent comments, ideas, and suggestions. I have tried to incorporate as many ideas as possible into this beta version.

The biggest change in this version is the addition of a comprehensive logging function (described below).

The major features of the beta version D are as follows:

1. Operates the RX-320 from virtually any desktop or laptop computer, including older 386 machines.
2. Works in either DOS or Windows (this is a DOS program).
3. Implements 34 selectivity filters.
4. All modes: AM, USB, LSB, CW.
5. AGC implemented: Fast, Medium, Slow.
6. Tuning steps down go 1 Hz or up to 1 Mhz.
New! 7. Now includes 3 Khz tuning step for marine channels. Also includes 9 Khz tuning steps for European AM stations.
8. Adjustable squelch.
New! 9. Pause S-meter function on front panel. This eliminates the "chuffing" heard on some RX-320 systems.
10. Bandpass tuning (offset from center freq.)
11. Scanning using scan files. Adjustable parameters.
12. Built-in scan file editor.
New! 13. Built-in logging function with log editor. Easily track, edit, sort, monitor, and export log entries. Items logged include station name (or notation), frequency, mode, filter, date, time, and S-meter reading. Time and date can be adjusted if you want to log in UTC or other time zone.
New! 14. More sensitive S-meter.
15. Almost all parameters adjustable (great for knob twiddlers like me).
New! 16. Tighter code for faster operation.
17. No mouse required (or supported).

Beta version D has been running for a couple of weeks on several computers, including an old B&W Grid laptop (80386 at 25 Mhz), an 80486 machine, and several Pentiums. It works equally well on all the tested computers.

As reported last time, it really is a lot fun to use an old DOS laptop to operate the RX-320 while sitting in an easy chair across the room. By the way, the RX-320 sounds great when played through a good stereo system. Also, I tried Michael Young's idea (April 2 posting on rx320@onelist.com) on how to wire a new serial cable to eliminate the chuffing and crosstalk heard in some systems - this solved my crosstalk problem.

I would be happy to supply free of charge this Beta version to anyone interested who has an RX-320. The software will not function without an RX-320.

The program is supplied along with several scan files in a single zip file. Installation and removal are simple, as the program does not affect any system settings either in DOS or windows (it does not mess with your registry, DLL's, or other system programs).

The program is easy to use - just press various keys to engage the different functions.

Installation, removal, and operating instructions are included.

A final version of the program is expected within a month or so, depending on feedback. It will probably be offered on a shareware basis for a nominal amount (all this work has to be worth something :-) The final version will have greatly expanded scan file and log capacity;and any inconsistencies, cosmetic irregularities, and faults will have been fixed. As always, the final program will be small and easy to install without effects on system files.

If you would like to receive the latest beta version at no charge, send me an e-mail at mktg@ix.netcom.com and I will send you the zip file by return e-mail.

Regards and 73,

David

Compare the stock filters on the 746 with those on the 756 (mfr's lit
should show the differences). The 756 has one more filter than the 746
- It must be a useful one, or ICOM would not have included it stock in
the 756. (It also must be expensive, or it would have also been
included in the746 as well).

In other words, the 746 has one less filter than the 756 - consider
adding the one they left out..

1509. VX-5 modifications

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-16 00:00:00 UTC
From: Mike Schwendeman <mikes3@rconnect.com>
Message-ID: <371772F1.F4156962@rconnect.com>
Source record: 110768

Good day, all!

A few days back, I had asked for some information on modifying the VX-5R, and had gotten some great info. For this, I thank those of you who added to the responses.

However, I believe I might have two differing opinions, or ways to do the mod:

One as shown in http://www.icongrp.com/~sllewd/vx5rmain.html says to remove the left-most solder ball. (This is described in the excelent graphic.)

A second modification, somewhat later in this same web site, describes removing the left TWO solder balls, the unit will have extended TX range. The text is quoted, below:

"By removing all solder balls and resetting the VX-5R will put it in FREEBAND mode. In FREEBAND mode there are no automatic repeater offsets for the ham bands and other bands as well. But removing only the two left most solder balls, the VX-5R's TX is extended to 48Mhz, and still keeps the repeater offsets. Because cellular is NOT unlocked when the radio is put into FREEBAND, I see no reason to put it in FREEBAND and loose the repeater offsets. "

My radio was received with four solder balls in place. I have removed the two left-most solder balls, as shown in this crude diagram:

( ) ( ) (ï¿½) (ï¿½) (ï¿½) (ï¿½) ( ) ( ) <-(Before the mod; as-received)
( ) ( ) ( ) ( ) (ï¿½) (ï¿½) ( ) ( ) <-(After the removal of the 2 left-most solder balls)

To recap the fine graphic: This shows an unmodified radio with three balls installed. (Once again, mine had four...)

The text in the graphic shows two solder balls remaining, asfter the mod.

My radio now has the same two solder balls remaining in place.

My question: Will the removal of the two left-most solder balls (as in the case with my four-ball-equiped unit) do something other than extend the TX range down a bit further, from 50 Mhz to 48 Mhz? -Or, should one remove two solder balls from the unit (as shown on the graphic), which would leave only one ball? (True, this does not seem too logical, but I'd rather ask the "dumb" question, than have this nagging item...)

I have elected to remove the two left most solder balls. I did the reset of the unit, and seem to get what I needed. (Tx in the 460 Mhz area.)

Would it be advisable for me to reinstall the solder ball in position # three? (At this point, my unit would have the BEFORE MOD configuration, as shown on the graphic. -This does not seem logical.)

Thank you!

Mkie Kï¿½JTA

1510. FS: Very Rare JRC NRD-93/NDH-93 + Access.

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-16 00:00:00 UTC
From: davez <davez@ticon.net>
Message-ID: <7f7sattpb1@galileo.ticon.net>
Source record: 110769
Cross-posted to: rec.radio.amateur.equipment,rec.radio.shortwave,rec.radio.swap

FOR SALE: (A VERY RARE....)

JAPAN RADIO CO. (JRC) NRD-93 COMMERICAL HF RECEIVER.
with: * NVA-92 outboard speaker
* 6.0, 2.5 , 1.0 and 0.3 kHz bandwidth filters
* One- BK Cable (MPKC03108)
* English Instruction Manual
* AC Power Cord (Unit wired for AC 117 Volts)

(Receiver currently has a JRC 8.0 khz filter in the 6.0 khz spot, includes the org. 6.0 filter, I will reinstall this org. filter before shipping if you prefer, but you will have to let me know. The 8.0 khz filter gives improved audio quality)

Includes the following OPTIONAL accessories:

* Cabinet MPBX 10832 for NRD-93 (Standard Light Green Color)
* JRC Scanning Unit NDH-93
* JRC CSD-182 wired remote control for NDH-93
* English Instruction Manual for NDH-93
* Cabinet MPBX 10828 for NDH-93 (Standard Light Green Color)
* 2 Meter Line Out Audio cable
* JRC 2 Meter- 24 VDC Power Cable (MPKC01741)
* Additional JRC IF Filter in "AUX" slot. (0.5 Khz)
* 3- Extra BK Connectors/Covers
* Spare semiconductor kit (6ZXJD00005)
* CMH-330 card extension board
* Extra AC Power Plug
* Extra AC Power Socket
* Extra Foster 1 watt Audio Matching Transformer (identical 600 to 8 ohms as is in NVA-92 speaker).

Unit(s) and accessories are in "excellent" physical and electrical condition. All is 100% operational, no problems what-so-ever !! I do not have the original box or packing (I have alt. triple box packing to ship just fine).
Unit was purchased new in 1989.

The only VERY SMALL flaw with the front panel is on the NDH-93 scanning unit at the right rack handle , the cabinet is VERY SLIGHTLY indented. This is not noticeable unless you REALLY look for it. I can send pictures of this spot if desired. The NRD-93 is perfect !!!

I'm a NON-smoker..and all is EXTREMELY CLEAN as well !!!

TERMS :
Price $ 3850. FIRM !!. Buyer pays all shipping !!! USA offers only
!! Cashier's Check or Money Order , NO COD's. Please e-mail direct if
intrested. Serious inquires only ..Please !!!!

Please see my web page for a picture and more information on this set:
http://www.ticon.net/~davez/wants.html

That's doable, though I'm surprised there isn't a simple leaf switch in
there someplace to accomplish it. Still, that's good to know.

>
>This clears all user-programmable things, like a soft reset. The manual
>does *not* say whether it also clears all of the radio calibration

>
> Dave

Yeah, that would be a bit more work. I"ve got access to some service
equipment, but I don't have the service manual. Buying that might be
almost the same cost as shipping the radio back for repair. I'll have to
think on that some more or see if we get any more explicit instructions.
Sounds like this doesn't happen too often.

Thanks for the info Dave.

kevin

Hello all,
I would like to say thankyou to the response that I have gotton in
regaurd to the repair of my Icom 730. The radio is back on the air.
Gary told me to got to the ICOMamerica sight and follow the FAQ link.
There I found a description of my problem and the solution.
Well it was R1 on the regulator board. I would think that this
resistor works like a fuse. When the meter lamp shorted against the
cabnet it took this resistor out. I replaced the resistor and the radio
came up like nothing was ever worng with the rig. Again thanks to all.

Yes it can, however it was designed to copy a digital signal on say VHF while copying an audio signal on UHF. It does have a rudimentary balance control for balancing the audio from both bands. It will, however only transmit on the band that you have selected and if you hear something that you want to reply to on the other band you must manually switch the transmitter over .

Grab a schematic for a IC-2SAT and duplicate the USA diode matrix. If
that does not work then you will have to change the CPU to the one
supplied in the North American version 2SAT.

1540. IC-735 keyer spped problem

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-17 00:00:00 UTC
From: gagnon@gagnon.fakeu-net.com
Message-ID: <3718a37a.1082975@news.u-net.com>
Source record: 110636

As many already know the Icom keyer unit for the ICOM 735 rig uses the mic gain slider control as the keyer speed control. Because it is a log pot the keyer speed is very difficult to adjust, with very little play allowed for great increases in keyer speed -- generally not very acceptable.

I have heard of certain modifications for this problem - such as using the squelch control instead etc. Does anyone out there have any more definitive info on such mods???

I would really appreciate a response.

Cheers....Larry Gagnon MW0AWC

1541. FT-2500M tone burst for Europe?

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-17 00:00:00 UTC
From: gagnon@gagnon.fakeu-net.com
Message-ID: <3718a459.1305917@news.u-net.com>
Source record: 110637

I have an FT-2500m, bought in the USA but am using it in Europe. I have obtained the modification from Yaesu (jumper across JP2006) to enable the 1750Hz tone burst necessary for some European repeaters. The mod does not seem to work with the USA microphone (MH-27).

Does anyone else have this problem and know of a fix???

Your help would be appreciated.

Cheers....Larry Gagnon MW0AWC

1556. Is Your Health At Risk? Re: Are Cell phone hazardous to health?

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-17 00:00:00 UTC
From: Tracey <tracey12@hotbot.com>
Message-ID: <3718CA72.78D58548@hotbot.com>
Source record: 110652
Cross-posted to: alt.cellular-phone-tech,alt.cellular.motorola,rec.radio.amateur.equipment,rec.radio.scanner

Are Cell phones dangerous? Is the Pope Catholic?

The ARRL annual handbook has some very interesting information in it regarding electromagnetic fields and your body. The government has released standards regarding maximum exposure limits per cubic centimeter of human tissues.

Not only is RF dangerous to humans, but so is the magnetic field around the antenna.
Cellular (not cell phone!) operations within the human body are altered by the presence of this magnetic field becuase unlike earths magnetic field, those of RF devices alternate rapidly between on and off. Actual damage has been documented if a field is too close to the cell. And, not only are radios dangerous to human cells, but so are magnetic fields from nearby power lines, some electric blankets, drills, hair dryers, etc.
Radio Shack sells a field detector, and I have heard that it is a good device, however, I do not know if it comes with information on exposure levels.

Power levels matter, but the closeness of the antenna to your body is really important.
Keep all antennas as far from your body as possible. Keep power levels down to the very minimum if the antenna is close to you. If using a cell phone, try to move the phone away from your ear as far as possible, or hold it in such a way that the antenna is pointing not along the side of you head, but away from it.
If you are using a mobile radio, try to avoid using more than 50 watts.
Depending on the frequency, you may experience what linemen who work for power companies experience after working on high voltage power lines. They say that the magnetic field causes a dull headed sensation, and you are not as able to think for some hours, or even as long as a day later. One lineman told me the only way he could overcome this sensation was to drink a "six-pack". I too have exprienced this literally mind numbing sensation after using 100 plus watts from an HF mobile. This surely is not good for your brain. Some brain level chemical operations are being altered by the magnetic field coming from the antenna.
Could something like this cause cancer? At this point, all the reaserchers are saying (is there big pressure on researchers to stay quiet??) is that documented damage has been seen in human cells after being exposed to high levels of RF and magnetic fields.

Some common sense rules that might extend your life:

1. Keep Hand Held Cell Phone usage to a minimum.

2. When possible, use an External Cell Phone Antenna on your vehicle.

3. The above applies to all Hand Held Radios.

4. In your vehicle, use antennas mounted on bumpers to minimize exposure.

5. Keep the mobile unit power levels under 50 watts if possible, and talk time to

a minimum.

6. Always use top quality cables with 95% shielding and keep the cables away from

your body in mobiles or at home.

7. Keep all connections points ultra clean! Dirty connections at the antenna
will increase your SWRs which will cause more RF to emit from the antenna cable.
Oxidation occurs when RF levels are high and moisture is added. The oxide
that
develops will lower the performance of your antenna, and may raise your SWRs.

8. Even on base stations, keep your power down unless the antenna is located far
away. It is not easy, but mounting any amplifier at the antenna is much more
efficient than running a 100 foot cable from your amp located inside your home.
Plus, you avoid the losses associated with long cable runs. High levels of Stray
RF from cables may harm you and your family.

9. Many newer power tools and hair dryers emit lower levels of magnetic fields.
A family member just bought
a new hair dryer that converts the 110 to 12 volts which greatly lowers the
magnetic field at the point where your hand is
holding it.

10. I suggest that you NEVER use an electric blanket, but you may find them to be
just too comfortable to avoid.
Most electric blankets use a series of wires and heater coils embeded
between two layers of cloth. Many blankets
use wall current to produce the higher temperatures you enjoy.
Essentially, you are laying a huge antenna over your body.
It is emitting 60hz magentic fields and it is located right next to your
skin. Even if the blanket was operated from highly
filtered DC, you still would have a magnetic field around it and you.
Remember how you used a D cell battery, a nail, and
a coil of wire to produce an electro magnet? Was that DC current you were
using? Sure! And, though magnetic fields
that turn on and off rapidly as in 60 hz power lines and RF devices is much
more dangerous, who can say that hours of
exposure each night to powerful DC magnetic fields is not harmful?
Think about your environment in which you exist on a normal day. Do what
you can to minimize exposure to magnetic
fields and RF. Keep power cords for tools, radios, hair dryers, away from
your body. Stay away from high powered
electric lines overhead. I would NEVER buy a home located next to
overhead powerlines. Especially those mounted on
large metal towers. Such a home would be bathed in 60hz magnetic fields
24 hours a day.

Everything I have stated here is of my opinion. I use RF and magnetic
fields to live and play, but I try to do all that I
can to keep exposure levels down when around them. It just makes sense.

Here is the heavy-duty, 22amp power supply designed and sold for use with the TS-450, 690, and 570. It will power ANY transceiver in the 100watt range. It has had very little use and looks and works like new. Includes manual. $145. (AES sells it new for $250, used for $180!) Tks es 73, Jan N0JR

1564. WANTED: Manual for Ameritron AL-811 Amp

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-17 00:00:00 UTC
From: w8wls@aol.comnospam
Message-ID: <19990417161445.02682.00001450@ng34.aol.com>

Please respond to my address at w8wls@aol.com if you have the manual for the Ameritron AL-811 amplifier. Thanks Bill w8wls

1565. Amp Supply LA-1000-A linear problem

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-17 00:00:00 UTC
From: "csc@smartt.com" <csc@smartt.com>
Message-ID: <371953E0.108F@smartt.com>
Source record: 110661

I am using an Amp Supply model LA-1000-A linear amp with four 6MJ6 / 6LQ6
sweep tubes.

I am looking for some help to solve a problem with it.

On the 160 meter band with about 100 watts drive it will produce about 100 to 150
watts RF out on key down. As the selected band increases the RF out inreases
dramatically.

For each band the key down RF out is listed below

160 meters 150 watts approx out 100 watts drive
80 meters 300 watts out 100 watts drive
40 meters 550 watts out 80 watts drive
20 meters >600 watts out 50 watts drive
15 meters >600 watts out 20 watts drive
10 meters >600 watts out 10 watts drive

As shown above it becomes more critical to drive and to some extent unstable
on the higher bands.

This particular model uses a tuned input on each band.

I would expect a more uniform output across the bands than what this amp is producing.

I have tried a complete set of replacement tubes of different manufacture with the
similar results.

If anyone has any ideas as to what could be wrong I would appreciate a reply
to csc@smartt.com.

Thanks,

Colin

1566. WTD Datong filter info

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-17 00:00:00 UTC
From: J Peitsch <peitsch@concentric.net>
Message-ID: <7fasjs$ruc@chronicle.concentric.net>

Ten-Tec items for sale. Selling #1 as a lot. All items
are very clean and work perfectly. I hesitate to sell these
as I just acquired them but I am moving to new house and could use
the cash for house purchase. (I have too many radios anyway.....)

1. #564 Omni VI+ (Option 3 upgrade) Excellent shape, very clean,
some very light scratches on top. Front panel is clean - no scratches
or signs of wear. Includes new manual and original 1.8 kHz filter.
(No original box - sorry.)

-#962 Power supply/speaker. Just purchased. As new.
Original box/manual.

-#705 Desk mic. Just purchased. As new.

-International Radio #752 2.1 kHz/MHz filter (just installed).

-International Radio #754 2.8 KHz/MHz filter (just installed).

I have used this rig for less than 5 hours since purchasing late '98.

$2,025.00 plus actual shipping/insurance for all.

I'll only sell individual items if I don't get any interest in the lot.

2. #238 2KW antenna tuner. Brand new, never used.
Taken out of box and set on bench. Never hooked up. (New $395)
Original box/manual.
$320.00 + actual shipping/insurance.

US, Certified funds/cash only. Will not ship out of USA.

Buy all for $2,300. + ship/ins.

Serious inquiries to: Charlie Hicks, WB0LJP chicks@ix.netcom.com

Can be seen in Omaha, NE area but antennas are coming down to sell
current house. I can send JPG or GIF as requested.

Now assuming that contesting.com caters to contesters I'l
coment. I would expect the ft 100 to be an esp good contest rig, or
the 847. In the case of the I seem to recal the QST review as saying
good for the casual contester on the 847 but not for the really
serious contester. Indeed simple logic would suggest that either it's
likely to be something of compromise rig. yeah it is all in one, but
like a jack of all trades it not a master of them all. every review of
the 847 suggests to me that it at best in VHF/satelite modes as dos
Yeasu's advetising of it. I have not yet form a firm opinion of the
FT100 other than it is likely not the radio for me, the 847 looks a
lot better for what I want.
>

Likely it is fundamental RF overload. You're in the near field of the
40m antenna. You get about 22 dB of isolation by getting outside
the first wavelength from the antenna. 6 feet is awfully close, you
want something more on the order of 130 feet, but any extra separation
will help. An outside antenna would be a big help in solving this problem
(it'd work better too).

But there is something you can do with filters that may help. The
problem is 40m energy getting into the front end of the VHF equipment
and desensing it. The reason it can do that is that the filters (input/output
networks) in the VHF equipment are likely pi-section, and that has a
lowpass response. So it will pass any frequency below its cutoff frequency
directly into the receiver (that cutoff frequency will be above the radio's
operating frequency, and way way above 40m, so the 40m signal can just
waltz right on in).

A highpass filter with a cutoff just above HF placed in the antenna lead of the
VHF receiver will stop the 40m energy from getting into the VHF receiver
without attenuating the VHF energy that it's supposed to receive. This works
for VHF comm radios and for TVs when the problem is fundamental overload
by a HF signal. Of course you also have to make sure that the HF signal isn't
getting into the VHF equipment by another route, IE the power supply, exposed
speaker wiring, etc.

If you're using a built in antenna on the FM broadcast radio (pull out whip),
you've got problems because there's no way to fit a high pass filter externally.
If it is hooked to an external antenna, you can fit the filter.

Note that a filter on the transmitter won't help. That would only be useful
if it were radiating harmonics. It can't help with fundamental overload problems.
Harmonics would occur at discrete frequencies. They wouldn't produce the
broadband symptoms you present. That's the classic symptom of fundamental
overload, and that can only be solved by separation or by better filtering of the
receiver.

Source record: 110714

Hello,

I was just going make a new posting to this group regarding this subject. I have no optional filters in the 746 and was wondering where to start. I have just recently started running the new PSK31 mode and would like to reduce near by signal interference a bit. If I bought only one filter for SSB should it be for the 9MHZ section or the 455KHZ section? From the postings I have read so far, it appears the 9MHZ session is the place to start.

Comments?

Install a bandpass filter in the antenna lead to prevent
signals outside the 2m band from entering the radio.
PAR makes a suitable helical cavity filter.

The problem with the current generation of DC to daylight
scanners masquerading as amateur radios is that they have
no front end filtering to keep out of band crud from overloading
them. So you have to buy an external filter to do it.

I'm looking for a battery charging set-up that will charge a FNB-38
9.6V, 600mAH and also work as a base station. When I bought this HT,
yaesu had already quit making them. I believe Yaesu's part number for
them was CA-9 Base Charging Stand(used with a NC-38B Charger)
I appreciate any help in locating this or any ideas on any set-up
that may work
Thanks much
David Preston, kf4opg

Just another reminder of this upcoming event THIS WEEK! We still have swap tables available, but may run out!

The Eastern Idaho UHF Society will be hosting a hamfest/computer swapmeet in Idaho Falls, Idaho, at the Elks Lodge on April 17th. This is an ARRL sanctioned hamfest with full license testing, swap tables, commercial, and a talk on the FCC licensing and ARRL, DXpeditions and the internet and ham radio.

We have a web page - http://www.srv.net/~wa4vrv/hamfest.htm

Hope to see you there!

I have noticed the same problem and also if your need to adjust the mike
gain for different modes then its not set right for the keyer.
I was thinking of using the NB pot, even put a differnet one in its place,
for the keyer because I never need to use or adjust the NB.
I do use the squelch a lot and wouldn't want to loss it.

Chris

Hello!

My wife and I are going to take our Tech No-Code Exam on Thursday, and we are looking into HTs.

We like what Yaesu's VX-5R has to offer with three bands, but I personally am not thrilled with it's small size. I also stumbled across ICOM's 4 band HT, but I know very little about it.

My question is to you-all, are the extra bands really worth having on an HT?

Am looking forward to your comments!

1616. 2m/70cm mobile transceivers

Source record: 110492

I am looking to buy a 2m/70cm mobile xcvr. I am somewhat familiar with what is available e.g. FT8100, IC207, IC2710 etc. Does anyone know of a web site with reviews of the currently available mobile radios? Any info would be appreciated.

Thanks in advance,
Larry Benko, AC0B

1618. Opinion wanted FT-50 vs. VX-5r

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-18 00:00:00 UTC
From: Jim Rizos <jrizos@nac.net>
Message-ID: <371A2594.77DD9F21@nac.net>
Source record: 110494

Hello-
I am a 14 year old ham and would like to purchase a dual band handheld. I have narrowed it down to either the new VX-5 or the older FT-50. I can get a FT-50 for much less than the vx-5 and I really do not need 6m as I will get a base station for that. Its just that I like the size of the vx5 and it appeals to me more than the ft-50. I am really stuck trying to decide price vs. size etc. Any opinions would be greatly appreciated!

I have a nice Icom AT-500 Automatic Tuner for sale that will handle
1000 Watts PEP or 500 Watts CW. It will work on any HF rig. I have the
cord to hook it up to your Icom HF rig like the 745, ect. or the IC2KL
Icom Amp. Have the AC cord and Operation Manual, but no Icom box. This
tuner will also work on DC power in case you want to run it mobile.
This Tuner is in Most Excellent Operational Condition!! I have pictures
of the Tuner on request for interested buyers...
I need $ 350.00 and I pay insured shipping to you, or would trade for
Yaesu VX5, 8100, or ?...
Thanks for reading my posting.

You have priced yourself into the higher grade units.
Cheaper service monitors do not have enough output level
to do duplexers since insertion losses can reach over 110dB
in a good unit. Most monitors do not include a frequency counter
per se, you use the FM monitor and observe the error on a
meter. I bought a Cushman CSM-50 (cell version of the
CE50) on eBay a few months back for under 1000 dollars.
It includes a tracking generator and spectrum analyzer--two
musts for cavity/duplexer alignment, and for looking for transmitter
spurs. I like the IFR units, but they are pricey. Stay away from
the Ramsey.

Pete

All other comments are good, but.....if your serious, use 250 MCM and have it exothermically welded (your electrical contractor will know how) to your ground rod. (preferably rods..plural) Mechanical clamps are not the best, inasmuch as they will corrode with time and thence provide a burn-out point if you receive a strike and/or leader. It won't be inexpensive, but either your providing protection.... or your not. Conversely, one can simply buy good, comprehensive insurance!

John:
I will only comment on size. I use the Vertex VX-10 for my volunteer fire department work and the compact size helps when I wear a fire suit. Our primary channel is simplex and twenty odd miles away. I usually hit it but sometimes have to switch to the repeater used by the Law Officers. They make exceptions in emergency situations. Don't let the small size fool you.

FWIW; there's about $80 difference in price,and the VX5 recieves SW from
5mhz up,plus 6M TX & RX.The May QST reviews the VX5 so you might want to
get a copy. I've used the FT50 for a year and plan on keeping it;great
rig,except for high battery drain,IMO.

For Sale: Original IC-706, which I bought new in 1996. Includes mic, power cord, manual, and remote mounting bracket for the detachable head (MD-63). Separation cable and main unit mounting bracket are not included, as I can't find them. Also includes an unused IC-706 commemorative logbook which was a promo with the radio when new.

Radio is in very good functional and cosmetic condition. Used lightly, and mostly as a QRP rig. See http://www.icomamerica.com/archive/IC-706.html for specs on the original 706.

$675 shipped USA.

1635. Transmission Line Calculator - DOWNLOAD FREE

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-18 00:00:00 UTC
From: AA3RL <AA3RLm9bw990@ix.netcom.com>
Message-ID: <371A63BF.7355@ix.netcom.com>
Source record: 110511
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment

Transmission Line Calculator - DOWNLOAD FREE

I have recently posted to my web site a transmission line calculator in Excel 7.0 format. I initially created the spreadsheet to design matches with Stubs and Series Section Line Transformers. Since then, other utility functions were added that have enabled it to replace the Smith Chart, the pocket calculator, and many computer programs for transmission line design applications. I hope you will find it equally useful. The web page shows screen shots of most functions. The download button is at the bottom of the page. Point you browser at
http://www.qsl.net/aa3rl/
follow the link to Transmission Line Calculator

The program performs the following calculations:
Length Conversion: Wavelength, Degrees, Feet
Series and Parallel Equivalent values
Capacitance and Inductance required for given reactance (X)
Air Wound Coil construction
Reactance and Length of Stubs
Stub Matching - Impedance (Z) over a 180 degree cycle along a lossless transmission line.
Impedance (Z) at any single point on a lossless transmission line (for stub matching)
Series Section Line Transformer (analytic solution) for impedance matching

Why another calculator program?
There are a variety of programs available to the Radio Amateur that will calculate virtually every transmission line parameter that one may need. However, I have found needed routines to be inconveniently scattered among many different programs. In addition, the programs usually require the data to be entered in serial form in order to obtain the calculated output. If another calculation is desired, all the data must be re-entered. As a result, I felt the need to create a spreadsheet style program where all input values are displayed and multiple "what-if" data changes may be implemented quickly with the click of the mouse.

Any question, comments, or constructive criticism is welcomed.

Oh yeah, this is a ham amp alright, made by that well-known, high tech company Astronics! You see alot of them in the old QSTs, when the "AfterBurners" were a sought-after model! And, it runs sweep tubes? On 6 meters?

Maybe we should BEG e-Bay to allow illegal CB amps to be advertised again, so that we won't have to wade thru this crap!

1637. FS IC 2SAT HT

I have an IC 2 SAT in great condition...unit has following
characteristics and accessories:

1. 1 battery and 2 battery packs for AA batteries
2. Power cords for charging batteries off the HT (includes cigaret
lighter cord)
3. HT will operate from external power source wid 5 W output
4. New rubber duck designed for 2 meters
5. Leather carrying case; additional foam rubber carrying case
included
6. PL board built in
7. Speaker Mike
8. Keypad for direct freq entry/DTMF calling
9. Extended Rx aircraft thru 200 MHz
10. 99 memories
11. low/medium/high power settings

Unit was tested at Dayton last year by Hewlett Packard and meets all
factory specs. Unit has no internal battery. Comes with operating
manual.

Asking $175 OBO + shipping.

Call Bob/WF3H at 610 261 9137 or email wf3h@ptd.net

Thanks

>We must also take into consideration the bird meters slug, they vary greatly
>from one to another. Take 3 different slugs all of them the same power
>rating you will see 3 different readings

The line section in the meter matters too. It isn't just the meter movement
as Bill apparently thinks. The guaranteed specification covers the entire
instrument. The meters are usually better than the spec, they should *all*
be better than the guaranteed spec, but it is the total instrument being
specified, not just the meter movement or its scale. Bird recomends using
a slug matched to the power level you expect to read. That tells me that they
want you to stay away from the lower end of the scale for best accuracy.
That makes sense because diode non-linearity is typically a bigger issue
at the lower end of the scale. This has nothing to do with the meter movement.

Gary

Hello Everyone:

Iï¿½m selling my President Jackson.

* This unit covers from 26.065 for 28.305mhz built in
* Has an open dual-clarifier with 14kc spread
* Am/ Fm/ SSB modes
* Mike gain control
* 10kc switch
* Roger Beep on/ off
* Nb on/ off
* Tx/ Rx lights
* Dual mode meter (signal/ mod)
* 30 watts output (ssb)
* 3-pin power socket
* Pa/ ext. speaker outputs
* All for $225.00 w/stock mike

Also this unit is a newer Jackson, it is black all around, except for
the small fabricated faceplate that goes around the signal meter and
channel display. (original received a large scratch iï¿½ looked really bad)

Extra equipment for sale:

NTR-1 Noise/Tone Reducer by JPS.

* Unit has notch/noise red/ bandwidth selections
* DC up to 15v
* $50.00

Thanks,

leel@uniserve.com

No, that is not what Bill apparently thinks, and in the testing of two ancient panel meters I did not suggest that.

The Bird meter looks like a 2% meter, judging by its size and workmanship.

> Bird recomends using
> a slug matched to the power level you expect to read. That tells me that they
> want you to stay away from the lower end of the scale for best accuracy.

In my posts on this subject I have advocated that. I am aware of the diode, but if the 43 is used at strictly 27 degrees or so the calibration should be OK at fairly low levels. Incidentally, there are some "hidden" adjustment pots that they set at the factory.

The Bird 43 has 50 markings. The smallest marking corresponds to 2% of full scale power. This corresponds to 1.33 SWR. They suggest "forget about SWR and just think in terms of forward power and reflected power". If reflected power is "very small" that is usually good enough, they say, except possibly in applications such as TV and certain pulse systems.

If I can't detect "any" reflected power, I don't care what the SWR is. If I really want to know small values of SWR I use a directional coupler (no diodes) and my spectrum analyzer to get the return loss.

The biggest hazards to the 43 are the hammerheads who abuse them.

I have tuned duplexers using a service monitor and a scanner. Just be sure you put (at least) 10 dB pads at the input and output of the duplexer to preserve the impedance match. Works fine if you know what your doing.

I have several available.

Both UHF and VHF to choose from. They are all very clean, and power up and receive nicely.

Package includes radio, power cord, microphone, and mounting bracket.

These radios are two channels with PL installed. One channel is active - the other is empty. Currently in the 151 Mhz area for VHF, and 453 area for the UHF.

$25.00 per VHF radio, and $35.00 per UHF radio - Plus $10.00 USPS Priority Mail shipping - shipping discount for multiple radio purchases.

If you have any interest in these radios - please let me know ASAP.

Thanks for your time...

>Bill W0IYH

Thank you for proving my exact point, Bill. The top meter is accurate to 3% of full scale or +/- 1.5 milliamp anywhere over its tested range. It meets this specification perfectly. Yet it is off by 20% [actually by 25% if you more correctly used (Actual - Reading)/Actual as the equation.] So the real accuracy can be quite poor and get worse the lower the reading - and yet remain true to the percent of full scale accuracy statement.

In the case of the second meter, the full scale accuracy is 1%. With only a percent of full scale accuracy statement, this meter must read to within 2 milliamps over its range. Yet at the low end of its scale, the 25 reading, it is off only 1.1 milliamps - much better than its accuracy statement. But again, the true accuracy based on a percent of reading is

over 4 times worse.

I think Bill has misunderstood my point - which is that percent of full scale as the SOLE accuracy statement tells you little about how well the instrument scales at lower readings. He has said that his *NEW* Bird was tested over its range and came out with an excellent report. This is great, and I am pleased for him. But someone else could have an identical model that met the same accuracy statement yet give entirely different results - especially on low readings. I would expect the models would be somewhat reproducible but without additional information, you cannot say for sure. Bill's data illustrates this exactly.

Great ideas, Eric! Best of luck to you.

Did I see TWO prices - $10.99 and $11.99 - for the registered product???

Hi,
I'd replace the word health with lives.
Yes, any RF energy exposure to your body is not a healthy thing.
But B4 cell phone's RF energy kills you, something else will.

Not so fast!

Look at the first meter. At 10 mA the error is 5% and according to the "rule" it should be 18%, if it is a 3% meter. At 20 mA the error is 1.5% and it should be 8.0%. For the second meter at 25 mA the error is 4.2% and it should be 8.0% if it is a 1% meter.

The conventional rule is not functioning very well here because it is too simplistic. If it were, the percentages at lower readings would be much worse. The top reading by itself does not tell the whole story about the accuracy of a particular specimen. Because of small system nonlinearities the % accuracy fluctuates across the scale. It can be pessimistic at full scale, for example. The data for meter #1 suggests this.

D'Arsonval Taut Band Meter folks "try" to maintain the best *average % error* over as much of the scale as they can, despite the conventional interpretation of full scale accuracy. The data shows this, and I have seen it many times.

I repeat: these meters don't just become real poor %-wise at lower scale readings.

More about the Bird wattmeter later.

I am running a large diameter wire from a grounding rod into my shack.

I would like to make a grounding bus (copper rod) and connect the rig, amplifier, etc. to it.

Would it be okay to use hollow coppper tubing or should I use solid.

The bus will be 36" long and 1/2' in diameter and attached to the back of the operating desk.

Your help is appreciated.

Source record: 110611

Rick,
I used 1/2" copper pipe, drilled every 6" with through-bolted grounding studs. Then used #4 solid wire (no sharp bends) from the end of the pipe out the wall and directly down to a couple of driven ground rods. Inside, all cabinets are tied to the "ground studs" on the pipe with 3/4" woven ground strap. Not as good as tying directly in to the power head ground (which is 40' away from the rig) but have noticed no ground loops and have no detectable rf in the shack. Not sure what you mean by "large diameter wire", but don't mess around with anything smaller than #4, and use MECHANICAL clamps, lugs, etc., no soldered connections. Each individual lead coming in from the tower and rotor is also as lightning protected as I could make it, using gas-discharge type protectors for each rotor control lead. I unplug everything that leads outside, tho, when mother nature gets serious.

Message-ID: <3719EFDE.92EE92C8@dvnc.net>
Source record: 110621
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

I have an ADI/AT-600 Dual band Handi-Talki that I would like to sell. The radio was purchased in June or July of 1997 and has been kept in a carrying case for nearly the entire time since then.

I am including the lighter adapter, a leather case and the original NiCad battery which seems to be holding up well. No modifications have been made to the radio, however, I removed the small rubber cap on the battery that prevents dust or moisture from entering the battery charge jack and punched a small hole into the case at the same location to facilitate charging without removal from the case. The original charger, antenna, and lanyard are also enclosed with the original box and manual. I also no longer have need for a second antenna. An ANLI 2-in-1 dual band antenna with a screw on rat-tail or telescopic whip. Gail with this antenna is advertised at 3.2db VHF and 5.6db UHF. The radio has a wide receive range for those scanner buffs and has the ability to cross band repeat.

The radio is in excellent condition. I have seen the same radio advertised on sale for $250 which included the high capacity battery so I am going to offer this at $205. The five dollars should help cover the shipping costs. I will ship to the lower 48. The method of payment that I would prefer is a cashiers check or postal money order. If you choose to send a personal check, clearing time for the check will delay shipment.

My reason for selling is that I just purchased the Yaesu VX-5.

If I am slow to respond to email please forgive me, I am presently working shift work and my schedule sometimes prevents me from getting to my email everyday.
Please use the email address to respond.

Got the bug to build a QRP rig. The 40-40 seems simple and ideal for a
first=timer like me.
Is there a retailer that sells this unit or another rig as a kit? I
don't have the time or inclination to sort through catalogs for the
parts.
What would be the ideal antenna?
Do I need an amplifier?

BTW I plan to put this kit in a backpack and hike to some remote Sierra
Nevada peak to make contacts.
Thanks for any help, Oscar.

1699. FS: Kenwood TH-79d w/ 2M only amp

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-19 00:00:00 UTC
From: wxspter@aol.com
Message-ID: <19990419113815.07381.00002267@ng103.aol.com>
Source record: 110428

I have a Kenwood TH-79d dual band radio with a 2M Maha amp, 2 5w batterys, manual, and I think I have the box as well.

I am asking $350 for all I prefer not to sell seperatly, I will pay regular ground shipping.

Thanks,

Robert
AB5EW

1700. 10 mt SSB FS

Newsgroup: rec.radio.amateur.equipment

FS nice 40 channel SSB CB converted to 10 meters, 12 to 15 watts out, professional conversion, all documentation, original box, mic, power cord cig.lighter adaptor, covers all SSB 10 meter frequencies, works the world from car, $75 shipped, Charlie, K5MBX

1701. WTD: Kenwood TR-7950 service manual, or help

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-19 00:00:00 UTC
From: pmb1010@my-dejanews.com
Message-ID: <7ffoeg$ke0$1@nnrp1.dejanews.com>
Source record: 110430

Have a TR-7950 on the bench, only puts out 4.5w high power,
3.9w low power. Suspect power module, or high swr feedback circuit.
Need someone with service manual to help me step thru voltages
in power module, etc.
Also, need help trying to figure out how tone encode/decode works
on this radio. I THINK it has the board, but not sure.
Pressing the tone button brings up some cryptic display on the
screen I can't figure out...

Thanks,
Vic

Why "should" the error of the first meter at 10mA be 18% or at 20mA
ought the error be 8%, etc.

I think you have totally missed Roy's point. A specification is a
promise of accuracy and not a promise of inaccuracy. If you're
measurements are correct then the observed fact that the meter is
more accurate than the specification at less than FSD is simply proof
that the meter is within its specification and not any sort of proof
that the specification is somehow wrong.

Regards,

I just finished the process of buying a used service monitor. Gary's pretty much right, though I have seen quite a few IFR-1500s for sale by the used equipment dealers; they generally go for about the same as a loaded 1200S (around $5-6k). As Gary noted, the thing that will run the price up is a unit that has a decent spectrum analyzer and tracking generator, which are really essential for cavity tuning (especially notch cavities).

If you don't need that, an IFR-1000S or IFR-1100S are nice units, with a very basic spec analyzer. They can be found for $2k plus or minus in flea markets. Be warned, though -- they're a complicated late-70s design, and can be very expensive to fix. And, I've never seen an IFR-500 for less than $1k, but anything's possible. :-)

A site with a lot of good information is www.amtronix.com -- he has lots and lots of used monitors listed, with a pretty good amount of detail. Prices there are more than you'd pay in the flea market, but seem to be in line with what most of the used equipment dealers are charging.

Hope this helps.

I plan to eventually, but I probably won't get very far--I can go either
40 or 50 feet, or about 10 (depending upon which side of the house I
hang either my inverted V or sloper). Just haven't had the time to do
it yet, and I haven't been active on 40 either to provide the
incentitive.

>
Interesting. I don't remember now, but I think my 2m multimode wasn't
affected--it has some sort of helical filter in it. The HT was what I
noticed the RFI on.

I haven't made a 10x or 100x probe yet for the spectrum analyzer here at
school; I think you gave the specs on it earlier. It was 470 ohms for
10x; 4700 ohms for 100x right? I noticed that when I tried to use an
oscilliscope to watch the output waveform of various transmitters, I get
what I think is a ghost image--another waveform with just slightly less
amplitude. I think it might be just the probe picking up noise in the
air, so I want to try to actually measure harmonic strength with the
spectrum anaylzer.

Thanks for the info; I'll try some of the suggestions in the near
future, when school isn't so pressing!

Source record: 110447

I'm becoming active in ham radio again and the first antenna I need to put up is a simple 2-meter vertical. Ten-years ago I had a Cushcraft Ringo Ranger and this was the standard. Is this still a good choice? (I assume Cushcraft has a "new and improved" version.) I don't want anything that is very obtrusive - that will come later with the 40-meter beam! :-)

1721. Plano Radio Shack selling used gear as new

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-19 00:00:00 UTC
From: "Michael K. Davis" <zilch0@primenet.com>
Message-ID: <7fg1dk$eg5$5@nnrp03.primenet.com>
Source record: 110450

I recently had an experience at the Radio Shack in Plano that deserves publication. This Radio Shack store is at Parker Rd. and Independence Parkway, in Plano, Texas. Hopefully, it's safe to assume their practices are not replicated at other Radio Shack stores.

I bought several items using a 10% discount coupon. When I got home, I discovered all were fine except for a single-channel FRS walkie-talkie that had been marked on the shelf with a blue "Clearance" label. I don't know what it normally sells for, but I had paid 19.95 less 10 percent.

Problem, there was dried mud in the grooves of the rubber hand grips! There were also many scratches (two dozen?) on the rounded edges and flat underside of the base of the unit. It had been handed to me at the store in a pristine box, that was pulled from a lower shelf behind the counter where a lot of their inventory is stored.

When I returned to the store, the next day, there were three other customers present, one being serviced ahead of me at the cash register. The store manager asked what I needed. I said, "I am returning this because it is obviously used. It has dried mud on the hand grips and several scratches in the case."

"That didn't come from this store..."

"It certainly did! I bought it from that gentleman there, just yesterday. Here's the receipt."

"Look, a lot of people try to pull funny stuff on us, but I just have to take their word on it." Looking at the receipt he said, "Well you didn't even pay for new equipment, you paid less than $18.00 for this thing."

"Oh, so does that mean that when Radio Shack Customers see a blue 'Clearance' tag, it means that we can expect to get used equipment instead of new?"

"Well, no..."

"Then don't give me any double talk about my not having paid for new equipment and insinuating that I have switched the new one for an old one. I bought this one here, yesterday, and I expect you to exchange it for a NEW one."

"I wasn't double-talking you, I'm just saying that you got a good price on it." He asked his associate to find another one.

Moments later the guy said, "You're in luck, we have one left."

The manager said, "Why don't we open the box here, and we can check it together?"

Get this: He pulled out the second one only to find it too had scratches and mud on it!!

I asked, "Why don't you just throw both of these in the trash, right now? They aren't new!"

He didn't answer. Two customers were watching, in line behind me.

"You guys took a pair of these on a fishing trip and brought them back all beat up. Are you going to take them to the bathroom, clean them up with a toothbrush and just put them back on the shelf? Is anything in this store new?"

The manager's only response was to whip around and pluck a newer-model $39.95 FRS radio off the shelf and ask me to take it instead. I obliged him and told him that he had redeemed himself, but not the store, but even that was generous.

He didn't offer any apology. He didn't declare any intent to get to the bottom of how such a thing could happen. He just threw me a bone to silence me.

Mike

I'll echo the info on the IFR 1500 as being a great choice since it's got just about everything you need built in....one of the best sprectrum analyzers in a communications monitor, tracking generator, sweep generator, ability to tune duplexers, SINAD/power/deviation measurements, etc. etc. They do sell in the $5-6k range. A couple of other places to check for info and availablity are RF Image (Paul Zeppa) at:

http://www.best.com/~rfimage/

and Feitek in St. Louis at:

http://www.feitek.com/INVENTRY.HTM

I got my 1500 from Feitek. Be careful, the CRTs in a lot of 1500s have been left on at high intensity for long periods and have ghost images burned into the phosphor. I sent mine back to IFR and had them put in a new CRT and align it again; the techs there told me that replacement CRTs were starting to get in short supply.

The 1200 Super S is a great box too (much smaller than the 1500), but will not give you as wide a spread on the sprectrum analyzer as the 1500 does (think the max is 1MHz per division for a total of 10MHz whereas the 1500 will go to 10MHz per division then full scan up to 1GHz). Tracking generator is an option with the 1200 series; I wouldn't have a monitor without one.

I spent a long time deciding which box to buy and am still convinced for the money the 1500 for me was optimal; if I had big $$ I'd get an IFR 120B or an HP8920, but that's just a pipe-dream!!!

Good luck!
Dino KL0S/4

> for it.

TenTec won't sell an amp with that rig. From what I understand it is
because it doesn't meet spectral purity at higher powers. So if you put
an amp on it, you may be causing interference outside of the amateur
bands.

Does anyone know if Ham Radio Center, Inc. in St. Louis, Mo. is still around. I was given a beautiful HAM-KEY with the company name on it. It has a black crinkled base, red holder/paddle and chrome handle. If you know anything about this key like dates it was manufactured etc. I would sure like to know. It works great with my HW-7 qrp rig I use portable for mountain topping.

> ought the error be 8%, etc.

If the accuracy is "allowed" to be 3%, then officially it is "allowed" to be 3% of full scale anywhere on the scale.

Example: A 0 to 100 meter is rated at 3% of full scale. This means that at 100 it "can be" 97 to 103, which is 3% of full scale. But that also means that at 20 it "can be" between 17 and 23, which is not 3% but 15%. Or at 10 it "can be" between 7 and 13, which is 30%.

Any worthwhile 3% panel meter that I have ever worked with is a lot better than that.

If a meter *just barely* meets that spec and is no better than that, then as I said, at lower readings the errors "should be" the larger numbers. That statement was correct. The cheaper junk meters do exactly that and no more, so that the meter is not very good except close to full scale.

If you read my writeup more carefully, I am saying that meters in practice are not built that way, and the data that I gave for two old knocked-around meters is a very good example.

> I think you have totally missed Roy's point.

I think you are totally missing my point. The specification is standard practice, but a meter that does nothing more than meet the bare minimum advertised definition of "full scale accuracy" is not one that I would buy if I can find something that goes the extra mile and tries to get a better "average % accuracy" over "most" of the scale. And you may be sure that I can in fact do just that. Read my post again (the part that you deleted from your reply).

The "% of full scale" spec is a tradition, and anyone just barely meeting the spec will not go to jail, but he will not compete with those who do a much better design and test job for the same sell price. I'm not talking about $1000 laboratory things in walnut cases, just ordinary $80 taut band panel meters.

These days an automated test station could take data points (using a computerized optical reader), calculate a linear regression and the standard deviations, min and max errors etc. and possibly tweak the meter mechanism (or reject it) in just 15 seconds. The old traditional "% of full scale" spec is a lousy way to do business since it permits a lousy result.

"Michael K. Davis" <zilch0@primenet.com> wrote:

> He just threw me a bone to silence me.

No, Michael - he "threw" you a new FRS unit that cost twice as much as what you paid for one.

Radio Shack has an extremely liberal exchange policy. You should read it sometime. It's on every receipt you get from them. In essence:

You may return any practically any item purchased within 30 days of purchase. No questions asked.

So...someone probably DID take those old-model FRS units out for a test drive. And returned them.

And all you had to do is return your item - for whatever reason - and obtain either an exchange or refund.

THAT extremely "pro-consumer" exchange/return policy is what needs to be published...not your silly little exchange with store employees.

I have an old MM-3 and I love it. It would be too hard to part with it now after using it for so long. Good luck with the search, though. If you find one, you can get a eprom upgrade to the lateset AEA had before they closed down. Call the guys at Timewave and talk to them about the eprom. They offered to burn me one a couple of months ago for my unit.

Anyone got one of these filters? I think it is used in the TS511, TS900,
TS520,
and R599. Not sure of all the numbers, but if it is a 3395 Kenwood CW
filter, it probably is correct.
Hope someone can help out!
...Dave

There is an excellent article in the May/June 1998 issue of "Power
Quality Assurance" magazine. It is about lightning protection in the

telecommunications industry. All of the required bits and pieces can be bought mail-order from the ham magazines. Use flat copper strapping and TIE THOSE GROUNDS TOGETHER!!! These techniques work, I am in the telecom business and we don't shut down radio offices in lightning storms. A old friend (W2KKK - SK) got stroked several times that I know about and never missed a beat or replaced any equipment. He had good grounds, good dissipators and good isolators. Or disconnect the radios and ground everything then Mom gets mad.

> Actually, buried somewhere in that study released a couple years ago is a
>portion which noted higher tissue heating and higher possible genetic changes
>with digitally modulated signals, as opposed to analog modulation. Sorry,
>can't site the specific part of that study.

How is that physically possible? Where is the extra energy coming from?
CDMA has the same maximum power output as AMPS. The signal is
constant amplitude, just like AMPS. The only difference is the broader
frequency span, and the greater coding efficiency which allows it to
work at a lower power level. TDMA isn't even on all the time. It time
slices, so total transmitted energy is less than AMPS. The extra
energy to cause extra heating has to come from somewhere. Where
is it coming from?

I can't add much about genetic changes other than to note that
electrophoretic ion migration is slower than the lowest modulation
rate, never mind carrier frequency, used in digital cellular phones.
So I don't see a mechanism for them to cause such changes. If there
are changes, there has to be a physical mechanism to make them
happen. What is it?

It should be kept in mind that correlation is not causation. Epidemiological
studies are of limited value because they can only show correlation, not
causation. For example, it can be shown that nearly 100% of serial killers
drank milk as a child. That's a correlation, but it certainly doesn't say that
drinking milk as a child causes one to become a serial killer. To prove
causation, a physical mechanism must be shown.

For all the things you want it to do, you need an IFR1500 with the
tracking generator option. That's about $15,000 new (haven't seen
any on the used market yet). But if you scale back your expectations
a tad, an IFR1200 will do what you need for about $3,400 used. If you
can forego the spectrum analyzer, an IFR500 would do, and can be
had for under $1,000 used.

Those are your best choices. Alternatives would be the Motorola
2001 or a late model Cushman. Stay away from Ramsey.

Source record: 110539

I haven't yet used one; in fact, I just decided to purchase a C5900DA because it has [most of] the features I want. My primary desire was for the tri-band (6m / 2m / 70cm) and full-duplex crossband repeat. The C5900DA has those features; neither the Icom 706MKII or the MKIIG, or the Yaesu Ft-100 offer FD/CBR (according to their respective Web sites.)

Standard's site listed HRO (Ham Radio Outlet) as a dealer; HRO's site doesn't show Standard under the alphabetical listing but will show the C5900DA with no status (in stock / special order, etc).

To be fair to HRO, I only noticed this on their site today; I do plan to call them on Monday. I've been very pleased with the courtesy and help received from them in the past, and just ordered a couple of smaller items via their Internet Store.

The next closest ham radio shop to me (Boston, MA) is in Newington, CT.

The ARRL "Members' Only" page does have a review of the C5900DA in Adobe's Portable Document Format (PDF).

Congratulations on your upcoming entry into amateur radio. I think
a four band radio might probably not be a great idea for a starter.
You have to take into account the activity on each band. 2 meters is a
must, and 70 centimeters (440) is also pretty popular in most areas.
However, unless you live in a metropolitan area, 1.2 gigs as totally
quiet, and six meters is more fun with radios other than HT's. I would
consider the vx5 because it does lots for the buck, or a dual bander
like the ft50, or maybe one of each.

1759. HELP: Fixing Old Midland 8 Micro Transistor 10-188

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-19 00:00:00 UTC
From: Chris Smith <n3cs@qis.net>
Message-ID: <371AAB1D.15B20F8E@qis.net>
Source record: 110544
Cross-posted to: rec.antiques.radio+phono,sci.electronics.repair,rec.radio.amateur.equipment

I am trying (learning?) to fix a "Midland 8" model 10-188 micro (2x2") transistor radio. I can't find a schematic anywhere, so I am partially done tracing and drawing. It's a bear to work on as it's SO tiny.

I do not get stations. The trouble is in the radio section (amp seems to work with signal fed at volume control). I do not have my old signal generator or o-scope working just yet, so I can't do a proper (easy) trace of the radio stages (a convertor and 2 IF amps). Bias on transistors look "reasonable," although I am suspect of 0 (or very close to 0) volts on both IF amp emitter resistors. Collectors read 2.x volts and bases are around 0.7V. The transistors are odd little white pill-looking NPN deals with "184" or "183" printed on bottom.

What is weird is when I touch the convertor's base with a metal probe, I can hear typical AM radio electrical noise/static and can actually tune in (using tuning cap) shortwave broadcasts! This implies to me the convertor and IF stages are close to "working." I think the convertor is working because I can detune it by passing a metal tip into the bottom of the IF can. I am wondering if the alignment has been monkeyed with maybe?

Everything I have checked/replaced so far looks good. (I did find 2 resistors that were close to 20% out of marking, so I replaced them).

Any ideas?

Chris

1760. Parts source for older HP test gear???

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-19 00:00:00 UTC
From: nq5t <nq5t@gte.net>
Message-ID: <371AADFA.840167A4@gte.net>
Source record: 110545

Anyone know where to find bits and pieces for older HP test equipment?

Specifically, the plastic meter escutcheon on my 651A generator cracked -- and you may know that this is also the part the clips and holds the meter in place. These were used on a lot of HP test gear -- 651-series, 331/4 distortion analysers, and a lot of other stuff. HP seemed to use one size meter and the same escutcheon/bracket on everything of the era ...

Any leads on where to look for one would be appreciated. Maybe you have one in an old junker that's headed for the dumpster??

Thanks ... Grant

Mr. Clark,

The newsgroup rec.radio.swap was formed for the express purpose
of buying selling and swapping equipment. The other newsgroups
you keep posting to are not appropriate for sales offers.

Have you given any thought to the obvious fact that your stuff is NOT
SELLING and why?

Most of the things you are offering are available for less from equipment
dealers. In most cases only equipment purchased from an authorized
dealer has a warranty. Why on Earth would anyone pay you more than
retail for used goods that will not have a manufacturers backing. The
audience here is a bit more sophisticated than you might think. If you
want to get your outragous prices off might I suggest ebay they seem to
have a number of buyers who just fell off the turnip truck over there.

Problem is, You'd be taking a step backwards! The 8100 is
junk. It is failure prone and has weak audio. They got rid of the
8500, which was the only thing that could hold a candle to the TM-V7.

>
>I've always used Kenwood ever since a bad experience with

Oh... yeah, thats the kicker. Little Cars+TMV7=no visibility,
although I managed to live with mine for awhile.

>So I'm considering the Yaesu FT-8100, but don't want to get
>rid of a rig causing me problems for another one that will be
>causing me problems. Please respond to this post with your
>experince good, and bad... thanks...
>

I had a late model FT-8000, which was basically the same radio, cept
no remote head. It broke once, and yaesu did a poor job of fixing it,
they fixed the RX but munked up the dual in band RX, I sent it back
again and yaesu claimed there was nothing wrong. (but it magically

came back repaired... hmm, yaesu too embarassed to admit their mistake?)

Currently I use an FT2500M. Better than either the 8xxx series or the TMV7... course its 2M only, but considering that theres only one good 440 repeater around here, 440 hasnt been a big issue for me.

-Mike

Please, don't forget that Yaesu is also notorious for providing tons
of frequency coverage with deaf RX. I tried putting in some active
repeater freqs on 220 mhz with the 8000 that I had, it was absolutely
deaf.

Yeah, that's fine if you want to wait 2 months to get
your radio back. Yaesu is all backed up fixing the broken
847s.

Not to mention the fact that they splattered something that
looked like orange juice on my friend's FT-1000. On top of that,
they also did a horrible soldering job on the new display unit they
put in his radio...

I used to think yaesu's factory service was the best, but
no longer. Not only does Icom and Kenwood factory
service suck, Yaesu has now joined the ranks
of crap service too! I will give them credit though, their parts
department is decent, if you want to fix it yourself or have someone
else fix it.

Greetings all,
I have a couple of items left:

1) Reagency RSP-500 VHF, 20 Channels 135-175 Mhz W/pl,DPL, scan, and priority scan 5Watts. There is a second unit with same specs that comes with the deal. Also 2 batteries (one for each radio) one antenna, one rapid charger, owners manual, service manual, and the programmer. The second radio does have one small problem, and that is the audio ic is bad, but very easy to replace, according to the service manual. And also one speaker mic. ALL for $375.- that also includes shipping.

2)Pace 6Ch UHF 10w radio with no mic $25.- Crystal radio W/pl

If you have any quetions regarding the radios please feel free to send me an email.

Thanks all
Dirk

From: Bob <friday@ccnet.com>
Message-ID: <371AD62F.BB45202D@ccnet.com>
Source record: 110554

FA: In excellent condition, an Icom IC-T8A Tri-Band HT. 6m/2m/70cm plus extended range receive including FM Broadcast. This is the High Power version. I will also throw in the optional alkaline battery pack. For those of you who find the auction method distasteful, I understand. So, I made it a point to offer this radio on this group prior to putting it up for auction, which I did with only tire kickers.

If you place a winning bid make it known that you saw the posting here and I will throw in the Icom leather carry case at no additional charge,

which is "not" mentioned in the auction description.

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=93147235

Good luck and 73,
Bob

I suspect that the local oscillator is not working...

You realy need a signal generator and scope to figure this out...

news:371AAB1D.15B20F8E@qis.net...
| I am trying (learning?) to fix a "Midland 8" model 10-188 micro
(2x2")
| transistor radio. I can't find a schematic anywhere, so I am
partially
| done tracing and drawing. It's a bear to work on as it's SO tiny.
|
| I do not get stations. The trouble is in the radio section (amp

seems
| to work with signal fed at volume control). I do not have my old
signal
| generator or o-scope working just yet, so I can't do a proper (easy)
| trace of the radio stages (a convertor and 2 IF amps). Bias on
| transistors look "reasonable," although I am suspect of 0 (or very
close
| to 0) volts on both IF amp emitter resistors. Collectors read 2.x
volts
| and bases are around 0.7V. The transistors are odd little white
| pill-looking NPN deals with "184" or "183" printed on bottom.
|
| What is weird is when I touch the convertor's base with a metal
probe, I
| can hear typical AM radio electrical noise/static and can actually
tune
| in (using tuning cap) shortwave broadcasts! This implies to me the
| convertor and IF stages are close to "working." I think the
convertor
| is working because I can detune it by passing a metal tip into the
| bottom of the IF can. I am wondering if the alignment has been
monkeyed
| with maybe?
|
| Everything I have checked/replaced so far looks good. (I did find 2
| resistors that were close to 20% out of marking, so I replaced
them).
|
| Any ideas?
|
| Chris

I have two FT-50 HTs, and haven't heard of a "excessive battery drain" problem
on current production models.

Are you using Yaesu's 9.6 volt batteries on High Power all the time?

I use FNB-47 batteries - 7.2VDC - and Maha makes a 1800mAH FNB-47 that
provides excellent performance for me.

I have been wondering the same thing, since I sold my VX-1R. I'm not really familiar with the radios, but doesn't the FT-50 have some features that the VX-5R does not have? I'm discounting the VX-5R shortwave receive because I don't think that I would use it much, being as it is AM only, and I have other 6M equipment, so 5W on 6M FM does not excite me. Sure, they would be cool. I don't care about out of band transmit either. Which radio is better from the "out of band receive, use the radio as a scanner, computer control, ease of use" angle? What about simultaneous dual band operation? I still have my old FT-470, and I like it a lot apart from the size.

Simultaneous dual band, including U-U or V-V, is the kicker for me. Neither
the FT50 nor the VX5 have it. The FT51 has it. End of story.

>or even different values to really see what a differance there really are
>between the slugs

Right. And the *same* slug can give different readings at different
frequencies within its specified range. The compensation is far
from perfect across the marked range. That same slug will give
different readings again if it is used in a different line section.
The machining of Bird line section castings isn't very tightly
controlled (a small difference in insertion depth of the slug makes
a pretty large difference in the indicated power). Then consider the
nonlinearity of the diode at different power levels, temperature effects,
etc, and you see that there are many potential sources of error. The
meter movement is probably the least of the factors in determining
the instrument's accuracy.

In our shop, we mark slugs to be used with a particular line section
and meter, and make calibration charts for the combination at the
frequencies where they will be used. (We have a Dielectric water
load with flowmeters and temperature probes so we can calculate
actual power and prepare the calibration charts.) That can get us
to about 1% of full scale for the higher power slugs. At low power
levels, uncertainties in flowrate and temperature differential can
lead to a larger percentage error for our calibration setup. So we
try to avoid using the instruments near the low end of a power
range.

I'd echo the sentiments of the fellows recomending used IC2 or HTX202
HTs. Good solid radios, available on the used market in your price range.
For new radios, the only things that fit are the Alinco credit card radios
and pager size radios. They look like toys, but they actually work better
than you might think.

Source record: 110333

I want to help out a couple of older receivers and was
thinking a pre-selector like the MFJ 1045/1045C might
help.

I have been offered the older model 1045 for about $20.
but the seller says it covers 1-50MHZ rather than 1.8-54MHZ
as the newer 1045C covers.

Anyone know if the older unit covers 6m?
(Or if it is readily modified to do so?)

Anyone know if these units are worthwhile?

Thanks! & 73,

> sense. [But I still cannot duplicate his numbers exactly.]

And you still do not understand what I am trying to tell you.

One more (and last) time. I am really sick and tired of this.

I am saying that a meter that just barely meets the full scale % (aka the Roy meter) is "allowed" to be a very poor meter %-wise at below full scale. The meter that I will buy is the one that is 3% of full scale, but designed so that the degradation of % accuracy is smaller than what the Roy meter tolerates. I *know* that I can buy such a 3% meter for the same price. In other words the % error across the scale is the thing that anyone in his right mind is going to shop for and compare.

"How well does the meter track across the scale?" This is the most sensible question that I can think of. When I evaluate a meter it is the FIRST thing that I look for. And if I compare brands X,Y and Z 3%-rated $80 meters, guess which one I will buy.

This preoccupation with the literal interpretation of "% of f.s." that is used in catalogs is not necessary. I think it is a lousy way to do business and vendors do it to make life simpler and less litigious for themselves (who can blame them?). But they can, and do, perform better than that, they just don't commit to it.

If you understand this simple message then you understand my point exactly. I have no interest whatsoever in the strictly legal "Roy meter". A meter that is off by +/- 3 units at a reading of 10% of f.s., or even +/- 3 units at 20% of f.s., is not desirable. I will not buy it and I do not have to. Instead of haggling about numbers to 4 decimal places, let's use some common sense.

The message is clear and simple. Why is there so much trouble with it?

I do not want to argue about this any more. If you nice (and one or two not so nice) folks out there think that I am "mind set", then so be it. I will believe

what I think makes sense and let it go at that.

> between the slugs

At this point in time the discussion is centered on the actual 0 to 30 uA DC meter itself and not on the Bird wattmeter. The meter itself has interesting problems of its own.

The Bird 43 is rated at 5% of full scale. The meter itself is probably a 2% meter. The other 3% includes the element and the built-in coaxial assembly. The 43 construction is "precision" as nearly as I can tell by looking.

As for the elements, my *new* 250H and 1000H for the 2-30 MHz range are *very good* (within a couple of tenths of a dB) in my *new* 43.

Tom-

I have the Icom T-8, and have been unhappy about a couple of things with it. I've been considering getting the VX5R as a replacement, and was curious about what problems it might have. It sounds like my main complaint about the T-8 also applies to the VX5R.

The problem you describe is most likely the result of intermodulation interference. Two or more strong stations on other frequencies, combine inside the radio to produce a signal that is on the frequency you are listening to. The "screeching" signals from paging transmitters are more likely to cause it, because they are usually running several hundred watts. When you use a magnet-mount antenna, signals are stronger than when using the rubber-ducky, so the problem is made worse.

Intermodulation interference is more likely when the radio is designed to receive a wide range of frequencies. There isn't much you can do about it unless you buy a band pass filter for each band, and change filters when you change bands!

Makes me wonder why the manufacturers don't put some sort of recieve
attenuator in their radios--most 2m fm work is done on the repeater,
some done simplex, but usually with strong local signals. The radios
have so much gain that they are bound to have IMD problems. Pop in a
20dB attenuator on just the recieve side, and I wonder how that would
affect this intermod problem that is so common to hear about these days
(with wide rx radios, that is).

Icom does this on many of their radios, linked to the squelch control.
The first half-rotation of the squelch control just raises the squelch
threshold without RF attenuation, but the remaining half-turn gradually
adds 10 dB of attenuation as well.

Source record: 110352

This radio is a terrible CW rig. Dont know about the Mark 2 version,
but the original was plagued by cw filter blow by, chopping of
characters
in QSK mode at speeds as slow as 20WPM, and fan noise on transmit
making it necessary to use headphones for weak signal copy.

The Alinco DX70 is a better compact CW rig -- the filters are not the
very best, but adequate for general use. In fact, I ran the IARU HF
contest a couple times and CQWW with one of these little rigs when in
Asia
along with a 2 ele quad. Performance exceeded expectation by a
significant margin.
Only flaw I found was no built in keyer, so I had to use my own.
But, this does not have 2M ssb.

If it were my money, I'd find an older ten tec corsair 2 for HF cw
work, and a kenwood TR751A for 2M ssb work, -- probably come out about
the same cost wise with much better performance (and you can even do
both at the same time)!

Both in excellent cosmetic and working condition with original manuals!

The 260A is their famous "Q" meter, covering 50 KHz to 50 MHz.
This is a late model unit that works perfectly.

The 250A is the Rx meter that covers 500 KHz to 250 Mhz and measures
resistance from 15 ohms to 100K ohms over the range. Measures capacitance as
well. This unit works perfectly and is accurate.

$250 each shipped CONUS. Q standards and inductors available for the 260A
as
well.

regards,

Chuck...K1KW

A word of caution concerning your grounding arrangement. Using separate grounds can cause problems, if a lightning strike hits near you it will make one of the grounds possibly thousands of volts higher than that of the other ground. Whatever you have between the two grounds at that point will surely fry. Obtain a good book on proper grounding and follow it's advice. Good luck and I do hope you get your interference problem licked.

I tried to address that a while back. The Bird 43 is a field
instrument, not a lab instrument. It must work over a very large
tempature range. Not only is the meter movement in questiion, but
also the components in the slug and mechanical accuracy of the
sampling line secment. You always have to allow for the worst case,
which migh only show up as 1 in 1000 while the others are much
closer, especially under more controlled enviroments.

Message-ID: <7fjib2bpk1@news.dakota.net>
Source record: 110361

I'm fixing a radio for a friend and need to locate a couple of transistors. The 2sc2954 and the 3sk131. The usual generic places (Mouser, JDR, Digikey, MCM) don't carry these RF transistors and there is no SK or ECG cross for them. RF Parts has them, but they also have a $25.00 minimum. Any help for a source would be appreciated!

Thanks and 73,
Joe ka0yos

1827. Yaesu FT100 Problem

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-20 00:00:00 UTC
From: Jim <n5jim@texas.net>
Message-ID: <371D513A.143E8016@texas.net>
Source record: 110362

I just bought a Yaesu FT100 from AES.
First impression of the radio was good. Works great on HF (40M and 75M).
I entered some local repeater frequencies and scanned for awhile. When the radio stopped on a couple of repeaters, I noticed that the signal strength was less than half of what I had gotten on other radios hooked up to the same antenna (Comet dual band ground plane @ 70" on top of tower).
Repeaters that normally were full scale are now S-9 on the FT100. I looked all through the menu to see if I had some attenuation on but there is no way to attenuate the receiver on 2M. I also read all through the manual, but did not find anything on changing the sensitivity of the receiver on VHF. The receiver on VHF and UHF is very dead. My wife was about 200 yards down the street in her mobile (50 Watts) and I was only getting 40 over S-9, the signal should have been FULL SCALE and then some.

Has anyone else experienced this problem wit the FT100's receiver ?
I plan on calling Yaesu tomorrow about the dead receive on the radio.

Thanks in advance,

Jim N5JIM

Perhaps it is your individual unit. I have one since March 11 and
regularly have had 2 meter simplex FM chats ranging 30-50 miles with
good reception. Your radio may need fine tuning with a service
monitor.

>QUOTE FROM CLINTBRAD4d:
" You should read it
>sometime. It's on every receipt you get from them. In essence:
>
>You may return any practically any item purchased within 30 days of purchase.
>No questions asked."

I think he did read it, but the store manager had many questions to ask
and snide comments for him such as first "accusing him of not buying it there"
humiliating him in front of other people, somhow having to bring up that it
was on sale ect.
QUOTE:
"No, Michael - he "threw" you a new FRS unit that cost twice as much as what
you paid for one."
Oh, so if a person were to buy a"new" sweater full of someone eleses'
sweat & b.o. & the manager gave that person an exchange worth more, (after
accusing the customer of falsehoods & ect) he should shut up & be grateful &
not mention what happened to him in that store?
QUOTE:
"THAT extremely "pro-consumer" exchange/return policy is what needs to be
published...not your silly little exchange with store employees."
Is this last one for real?? I got a steak dinner at a resteraunt that
was served to me bitten & full of mud, but what REALLY needs to be said is
what a great policy that restaurant has on returning & exchanging their
stuff??? We all know who you must work for, but guess what, the Emperor
really has no clothes, and it's OK to say it.

1838. FS: Johnson Thunderbolt and spare tubes

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-20 00:00:00 UTC
From: k9sqg@aol.com
Message-ID: <19990419225357.18900.00002633@ng134.aol.com>
Source record: 110387

Have acquired a Johnson Thunderbolt and decided that it is too heavy for my operating table, let alone my back, hi. Condition: 7-8, perforated cabinet could use a repaint for the scratches, but no dents. Front panel not too bad, haven't cleaned it yet, but meters look good. Dial pointer needs restringing. Power cable needs new connectors. I have not plugged it in yet. Have what appears to be an original manual put into a binder. Not sure if it has solid state rectifiers or not but there is a spare set of rectifier tubes to go with it. This is pick up only in Dayton, Ohio, or Dayton Hamvention. Previous owner said he had it on the air a couple of weeks ago.

For seperate sale, a spare set of 4-400 tubes that I was told are full output but I have not had the amp up and running to see.

This is all I know about the merchandise. If you're interested, I'm taking offers for the next week or so and will see what happens, hi.

Guaranteed as stated or your money back
****

1842. FS Saber 1 uhf 12ch $240 w/2batt.

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-20 00:00:00 UTC
From: xeon <xeon@ultinet.net>
Message-ID: <371BFDC4.C323CD8A@ultinet.net>
Source record: 110391

Saber 1 uhf 12ch
6D core, H/pwr, non secure
Model # H44SAN7139CN
comes w/ 1 batt.motorola used (not so good)
plus 1 brand-new batt motorola (7.2v @ 1800 ma)
& ant. the shape of the radio is in
good shape I'll give it a 7.

*** Note ****

Asking $240.+ you paid for S+H

**** Need to read radio for band spread ? ****
Don't know band spread!

I'm not going to paid someone $40 or $30 so i can read
the radio. If I'm not going to kept it.

Then i used my scanner to see what were the
CH. And this is what i found.

Ch. 1 447.285
Ch. 2 449.925
Ch. 3 460.000
Ch. 4 460.500
Ch. 5 449.125
Ch. 6 447.125
Ch. 7 --- Blank
Ch. 8 --- Blank
Ch. 9 --- Blank
Ch. 10 --- Blank
Ch. 11 --- Blank
Ch. 12 --- Blank

Save $40 or $30.

And this is why I'm selling it!
1) I got it with a trade!
2) It cost to much for me to keep this radio.
I would need a charger, software, cable,
rib box and get this a 386 computer. Ha

You can e-mail me

:I'm looking for information about the Motorola carvox 3100 autotelefoon for
:using it as a 70cm packet station. Are there some people out there with
:service manuals and / or having used it for 70cm radio amateur freq.?

Could you give some more info? Motorola produced numerous mobile radios
in the 1960s through the 1980s with model numbers ending in 3100, which
would indicate a radio with CTCSS squelch and one frequency. The complete
model number such as U44LHT-3100 or similar will be needed to identify your
radio. Most of these Motrac/Motran/Mocom 70/Mitrek series radios will tune
up just fine on 70cm if originally set for the 450-470 MHz commercial band.

Rx/Tx turn-around time may be a bit slow on some of these units for packet
work, others will be fine. But we need a complete model number to determine
which of several models you have. Or post a scan in alt.binaries.pictures
with a pointer to it here.

This is EXACTLY the statement I have been trying to convince Bill of all
along. Change the words in his previous posting and things make much more
sense. [But I still cannot duplicate his numbers exactly.]

>Look at the first meter. At 10 mA the error is 5% and according to the
"rule"
>it should be 18%, if it is a 3% meter. At 20 mA the error is 1.5% and it
>should be 8.0%. For the second meter at 25 mA the error is 4.2% and it
should
>be 8.0% if it is a 1% meter.

The accuracy statement supplied by the manufacturer does not tell you what
the error is at any point. It just sets bounds on the error. A corrected
wording _might_ be:

At 10 mA the actual error is 5%, and according to the manufacturers
accuracy statement, it could be as high as 15%, if it is a 3% of full-scale
meter. At 20 mA the actual error is 1.5% but it could be as high as 7.5%.
For the second mneter at 25 mA, the error is 4.2% but it could be as high
as 8%
based only on the full scale accuracy of 1%.

>Example: A 0 to 100 meter is rated at 3% of full scale. This means that at
100 it
>"can be" 97 to 103, which is 3% of full scale. But that also means that at
20 it
>"can be" between 17 and 23, which is not 3% but 15%. Or at 10 it "can be"
between
>7 and 13, which is 30%.

Which is the point Roy Lewallen made.

>Any worthwhile 3% panel meter that I have ever worked with is a lot better
than
>that.
>
>If a meter *just barely* meets that spec and is no better than that, then
as I
>said, at lower readings the errors "should be" the larger numbers. That
statement
>was correct. The cheaper junk meters do exactly that and no more, so that
the meter
>is not very good except close to full scale.

No, at lower readings the errors do not _have_ to be larger numbers. But
they _CAN_ be and still meet the full scale specification.

>15 seconds. The old traditional "% of full scale" spec is a lousy way to do
>business since it permits a lousy result.

Which was my contention all along...

>Bill W0IYH

There is a small enough amount of data here that it can be done by hand. Taking the first meter, for example, we can either fit the best straight line though the data points, or if we assume the meter was properly zeroed first, we can force our calibration to go through zero. Doing the latter gives:

Predicted_Value = 0.97213 * (Meter_Reading)

Without forcing the calibration to go through zero gives:

Predicted_Value = 0.98537 * (Meter_Reading) + 0.47205

If you look at the errors between these predicted values and the actual values, you will still find the worst error at the 5 mA reading. On the 10, 20, 30, 40 and 50 mA points on the scale, the above equations come to within 2.5% - an excellent meter. But you cannot read into this data that which is not there. Is the meter nonlinear below 10 mA, or is the 5 mA point just a bad reading? You can say only with further testing, not with this data.

But again, with only the 3% of full scale statement to work with, you would never know this. Bill said he had his meter checked against a calibrated Boonton RF voltmeter. So he can say with certainty that his meter is good over the range he checked. Another meter may not be nearly as accurate as his, yet it still meet Bird's 5% of full scale accuracy.

: up.

Intermod probs??? no I never said anything about intermod
problems where I live most of the radio spectrum has moved
up to 800-900mHz very little in vhf, and almost none in uhf.
The problem is visability with the display in daylight.

: Problem is, You'd be taking a step backwards! The 8100 is
: junk. It is failure prone and has weak audio. They got rid of the
: 8500, which was the only thing that could hold a candle to the TM-V7.
: Oh... yeah, thats the kicker. Little Cars+TMV7=no visibility,
: although I managed to live with mine for awhile.

Well I'm taking everyone's pros and cons into consideration.
and BTW, my "little car" is a 1995 Chevy 1500 extended cab truck,
far from little. I have the radio mounted in the back along with
an motorola spectra, and the control head for the TMV7A and the
Spectra up front mounted to my center console.

: Currently I use an FT2500M. Better than either the 8xxx series or
: the TMV7... course its 2M only, but considering that theres only one
: good 440 repeater around here, 440 hasnt been a big issue for me.
: -Mike

Thats the problem, my requirements are that of a dualband radio,
just go check my webpage out, you'll see how many kenwood 2 meter
mobiles I have. 3 of my bunch are sitting in boxes on the shelf
not even being used. I need dualband.

:
: Please, don't forget that Yaesu is also notorious for providing tons
: of frequency coverage with deaf RX. I tried putting in some active
: repeater freqs on 220 mhz with the 8000 that I had, it was absolutely
: deaf.
: -Mike

I'll take that into consideration, but atleast thus far with my
VX1R everything I've tuned up has come in just fine. I'm also
not asking for the ft8100 to do EVERYTHING but 800mhz receive
would be a plus for me since I have so many public safety agencies
here on it now... Thats one of the only things I wish kenwood
had kept in their duals, 800mhz... intermod and all of tha crap
isn't a problem for me, we're pretty clear down here where I'm at.

People keep refering to the meter movements accuracy , I question the slugs, check from one to the next . What good does the meters accuracy mean If my slug reads higher than someone elses slug , I guess now there is now 2 things to consider with regards of accuracy, the meter movement and the slug. Again, either you guys dont own more than one slug of the same value or even different values to really see what a differance there really are between the slugs

1863. Yaesu FT-1000MP for sale

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-20 00:00:00 UTC
From: mrauchle@aol.com
Message-ID: <19990420092540.06243.00003282@ng-ba1.aol.com>
Source record: 110412

I have a mint Yaesu FT-1000MP, purchased new from HRO late 1995. Has AC supply built in, (2) 2.0 SSB filters, (1) 500 HZ collins mechanical filter, (1) 250 HZ CW filter, DVS-2 digital recording unit, FH-1 contest CW keyer keypad, MH-31 hand mic, orignal box and manuals.

I have just recently sent it to Yaesu for an alignment and factory mods update. I have the receipt to substantiate that. I am a non-smoker and I am selling it because I have just purchased a TS-950SDX. I am interested in selling it for $2400 shipped UPS ground insured CONUS. That is a savings of at least $1200 if purchased new with all stated options.

I'm certainly not a technical expert...but from my simple observations, "Life" is hazardous to your health. So, it seems to me all the fussing and worrying in the all-caring media (scientific included) is quite a bit overdone. Just my opinion from a simple person.

Jeff Johns wrote:
> I use a longwire and a Rainbow tuner by the New Jersey QRP Club.

What is the advantage of using a long wire antenna? Other than ease of stringing up something, that is. I hope to do some QRP this summer myself, but I was planning on using a dipole, with a 1:1 balun (which I have yet to build, so it might not wind up as 1:1) and a transmatch (which I built from one of Dan's kits). If I use the dipole, I wouldn't run into the problem of needing a counterpoise, but is there some drawbacks to using a dipole instead of a long wire?

For me it's just convenience <g>. The dipole possibly may perform better,
but the 1/2 wavelength longwire I use does work. Of course I do use a
counterpoise.

One of the finest 2Meter performers - the Radio Shack HTX-202 - should be
available USED for about that price.

Check with your local Amateur radio club(s). They should be a welath of
information for you and your group.

I found that the FT-8100R is better than my old two meter rig on 2 meter intermod. There is an area that I drive by on my commute that used to blast my old Radio Shack mobile for about a mile with garbage from pager transmitters. If I have the squelch set very loose on my FT-8100R it may break squelch as I pass near the transmitter but most of the time it is quiet. Big Improvement.

The correct location is on the digital unit. They are directly behind
the battery. One model has all 5 diodes. Try cutting all 5, it should
work.

1881. WTB: Yaesu FT-901D/DM, FT-102

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-21 00:00:00 UTC
From: kirby.nesbitt@velocity.bc.ca
Message-ID: <924664227@velocity.bc.ca>
Source record: 110230

Looking for a vg or excellent condition Yaesu FT-901D /DM, or FT-102
Transceiver.
If you have one that meets the requirement, please email me directly
stating; model particulars, options and accessories supplied, condition,
and of course asking price.

Mark Johnson (silversq@ix.netcom.com) hath said:
: I found that the FT-8100R is better than my old two meter rig on 2 meter
: intermod. There is an area that I drive by on my commute that used to
: blast my old Radio Shack mobile for about a mile with garbage from pager
: transmitters. If I have the squelch set very loose on my FT-8100R it may
: break squelch as I pass near the transmitter but most of the time it is
: quiet. Big Improvement.
: 73
: Mark
: AB0HJ

thanks for the info.. Atleast if we ever have anything really
bad down here it would be good to know that it is standing up
to some of the other manufactures.

Burn her, she's a witch! And how do you know she is a witch?
She turned me into a newt! Ahhhh newt? I got better.......

A friend of mine is looking for a Yaesu MD-1 mike for his 902. He tells me the
current mike, the MD-100, will not work without a voltage which this radio will
not supply through the jack.

If you have one you don't need, please e-mail me.

Thanks and 73, Bob

1885. Wanted: antenna tuner for FT747

Newsgroup: rec.radio.amateur.equipment

1890. Re: IC-T81A

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-21 00:00:00 UTC
From: edial@cisco.com
Message-ID: <371ec3d6.14614161@news.cisco.com>
Source record: 110239

The T81A has an extra band (1.2GHz), much better continuous coverage receiver performance (48MHz - 1300MHz on non-US versions), the 81A is plastic and a little larger. The front end is much more selective on the 81A also. I HATE the little rocker button on the front of the 81A.

The VX-5R covers something like 300Khz-15MHz, although not very well with the supplied antenna. It does a much better job on external. It will not decode SSB or CW (no BFO). The 5R is a metal chassis, feeling very solid in the hand. The sensitivity rolls off rapidly once leaving the VHF-Lo, VHF-Hi, and UHF commercial/amateur bands.

Both units perform magnificently on the amateur bands. The 5R is a little susceptable to intermod/front end overload from adjacent stations, particularly paging stations.

Both remarkable radios. I usually carry my 5R while using the antenna from the 81A, mainly because of the ultra-compact size.

1891. Re: D-104 info...

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-21 00:00:00 UTC
From: "Robert G. Schaffrath, N2JTX" <rschaffrath@acm.org>
Message-ID: <371DCA75.4989@acm.org>
Source record: 110240

Hi -

I have a T-UG9-D104 and the following information is from the
accompanying sheet (their wording):

Frequency Response: T-UG9 essentially flat 200Hz-20kHz.

Output level: T-UG9-D104 @ 1000Hz. 1 meg. Load = -20dB re 1V/microbar.
5000 load = -26dB re 1V/microbar.

Output impedance: 5000 ohms or less.

Amplifier voltage gain: 26dB

Battery drain: 1.2ma

Temperature range: Approx. -30C to +45C (limited by crystal)

Everything else on the sheet is pretty much marketing information (like
"Microphone receptacle: On top of stem, offers instant microphone change
versatility").

Parts are still available from the Astatic division of CTI Audio for the
microphone. I had to purchase a new cable 2 years ago to replace what
was then a 20 year old cable. They can be reached at:

CTI Audio, Inc.
341 Harbor Street
P.O. Box 120
Conneaut, OH 44030
(216) 593-1111
FAX: (216) 593-5395

GL, it is a nice microphone and I use one with my Yaesu FT-757GX II.

73,
Robert, N2JTX

Greetings!

I recently ordered a new Icom 706 Mk2 and have created a mail list at Onelist.com where interested people can exchange information about this radio.

For those of you who may not be familiar with Onelist, it is a free service that allows you to post questions and other information about your specific area of interest and will forward all other messages to your mailbox either individually or in digest format.

I first discovered this when I bought my Yaesu VX-5. There is a Onelist Group for the VX-5 that has been extrordinarily informative and helpfull.

If you are interested, please go to www.Onelist.com and subscribe to "Icom706". If possible, please contribute something concerning your Knowledge or experience with the Icom 706, no matter how trivial you may think it is. Thats how a group gets started.

If you have any questions about this you can email me directly.\

Thanks,

Dave Alden KB8VJD d-alden@concentric.net

>then some.

Is the receiver really dead or is this just your first experience with an
S meter calibrated more honestly than usual in amateur equipment?
If the meter is honest, it should read about S9+50 in the situation you
describe. There's about 43 dB of path loss there. (Surprised? There's
a very large path loss in the first few wavelengths because path loss
doubles for every doubling of distance, and the first several doublings
don't cover much distance.)

The real question is not what the S meter reads. The real question is
how weak a signal you can hear. Try A/B tests with your wife's car
next to yours and see which repeaters you can hear. If you can hear
every one that she can with her rig, then quit worrying about what the
S meter reads. Just be proud that it is more honestly calibrated than
most. Only if her rig picks up lots of signals yours can't should you
be concerned. Then I'd go to the trouble to setup an A/B test on the
same antenna before I'd blame the radio.

It is possibly one of the worst intermod units I have ever tried. The 733 is just as bad and the new TM-V7A is also bad. It does have an attenuation fix but then you lose many weak sigs. The only Ken that seems ok is the TM 261. All others are useless in or near a city of size. Yaesu FT 8100 or 8000 are the best and Icom 2710 is decent. Never owned an Alinco.

Message-ID: <371E211F.D18A9A29@quantacorp.com>
Source record: 110257

Tony:

Here is a simple list of known problems, how to test and fix them:

1. Speaker howl.

1a. Testing: Set radio to 450Mhz, transmit near silence (just background noise) from another radio, turn volume knob from low to high. At some point (half point in mine) the speaker will start to 'howl' (245 Hz square wave on mine). It is not a distortion of voice because of tiny speaker, not feedabck, but a self-generated tone that seriously disturbs understanding anything. It only occurs with the internal speaker, not external ones.

1b. Causes: The speaker board is linked to the audio one by a thin flexible circuit where a single ground wire isn't enough to carry the current to the speaker without disturbing the reference levels, causing this oscillation. The original design had the mettalic case as carrier for these higher currents, but the painters of the case never knew about it.

1c. Fix: Yaesu acknowledges the problem, send it for warranty repair. If you are in Timbuktu, open the radio, scrape paint off the four quarter circles that are internal, on top of the battery compartment, around the four bottom screws. They should make connection to the keyboard p.c.b. Don't file them, otherwise they will be too short and not touch the board above. If they somehow don't, also scrape paint off internally around each case screw hole on both halves of the case.

2. CTCSS scan.

2a. Testing: Program a memory location to 145MHz, tone squelch 100Hz. Start a memory scan, transmit at 145MHz first without tone from another radio. It should not stop scanning (this is just to make sure you set tone squelch in the memory correctly). Then add 100Hz CTCSS tone to the transmitter, try again. It should stop, but on radios with the bug it doesn't.

2b. Causes: The VX-5 does tone detection partly by software, not a detector chip that would give a go/no-go to the CPU. This bug is caused by faulty firmware.

2c. Fix: Yaesu also acknowledges this. The only fix is to replace the CPU. If you are in Timbuktu, don't use ctcss squelch in memory locations, it won't cause you much trouble.

3. CTCSS delay

3a. Testing: Set radio to 145MHz, tone 67Hz. Transmit from another radio, without tone. It shouldn't open. Now set tone to 67Hz, and try to measure the amount of time it takes to open. On most radios about a half-second is normal at this tone (higher tones open faster). On good VX-5s, it takes about 3/4 of a second. On defective ones it takes 3/4s once, then 2s, then 1s, then 3s, then 3/4s again, then doesn't open, etc.

3b. Causes: The VX-5 does tone detection partly by software, not a detector chip that would give a go/no-go to the CPU. The software is faulty or interrupted too much by other CPU tasks, losing sync.

3c. Fix: Yaesu also acknowledges this. The only fix is to replace the CPU. If you are in Timbuktu, don't use ctcss at all, or you might not hear that anouncement about the dry oasis and die of thirst.

Please add this list to the FAQ, report other bugs that have a testing procedure, at least. It could be also helpful if people knew what radio lots have or not the problems. THe CTCSS delay seems to be present in all but the latest version still to come from Japan.

You might want to send the radio in right away, to be able to use ctcss, or wait a little, as Yaesu might add english units and perhaps other features like password lock to protect against stealing, etc. Don't wait past your warranty period, though!!!

It might also help if people send e-mail to Yaesu asking for the English units, 800 cell-only blocking, and perhaps even the new anti-theft feature that car radios have had for years and that Yaesu could add with a few extra bytes of code. E-mail to "Yaesu Musen Co.,Ltd" <yaesu-int@yaesu.co.jp> and "Yaesu USA" <yaesu@postoffice.worldnet.att.net>. Be nice, they are very responsive. Ask politely, don't forget the magic word... :-)

Regards,
Jose

Jim-

Are you sure the receiver is dead, and not that the S-Meter is insensitive?

To check the S-Meter, you need a calibrated signal generator. Setting the generator for an output that would produce 50 microvolts into 50 Ohms, the receiver's S-Meter should read S-9. (To compensate for impedance mis-match, greater accuracy can be attained by generating a higher level signal and using an accurate attenuator between the generator and receiver input.)

Unfortunately, it seems to be a "fact of life" that S-Meters don't conform to standards. Even if yours agrees with the 50 microvolt for S-9, it is unlikely to conform to the 6 dB per S-Unit standard, although it may have an accurate number of dB over S-9.

Ones I've checked were nowhere near the 6 dB per S-Unit standard. One problem, especially at higher frequencies, is that front-end noise may be greater than a signal that would produce the S-1 (0.2 microvolts) or S-2 (0.4 microvolts) reading.

I'm not familiar with the FT-100, but the IC-706 has both a 20 dB attenuator and a 20 dB pre-amplifier. The S-Meter is most likely designed for use with both of these turned off. However, the pre-amp is just about necessary for use on 10 Meters and above, which makes S-Meter readings quite generous. You should judge your S-Meter readings with that in mind. Perhaps the FT-100 was designed to compensate the S-Meter when the pre-amp is turned on, and those other radios weren't.

OOPS!

Thanks for pointing it out, Ed. Here are the correct numbers:

2. DC readings on the display

3.6V - 4.9V 'Dry'
5.0V - 9.9V 'Lit'
10V - 16V 'EXT'

Below 3.6 mine doesn't work, and 16V is maximum per specifications. It might fry only at 18, but I'm not finding that limit on mine... :-)

I am assuming you meant 3kw???? You need to know the PRF (Pulse
Repetition Frequency) and the pulse width. It is also helpful to know
the gain and dimension of the radar antenna.

Lots of bad comments on the Shack....but why do you keep going back? Because they are the only game in town. I do it too. I've gotten some great deals and service from them and have had some bad to go along with it. Luckily, my local Shack where I now live in Indiana is very good and will do whatever it takes for service recovery. I got a great deal on 2 HTX-202's when they closed them out. They told me up front that one of them had nothing but the battery pack, but they would order everything else and I'd have the stuff within 2 weeks. After a second request and 4 weeks, I not only got the missing accessories, but they threw in a new spare nicad pack to make up for it. They didn't have to do that. And..I have to confess I've made purchases and opened the package only to find I bought the wrong part. When I take it back are they supposed to throw it away because I made a mistake and opened the package? I've bought my share of phono plugs that were taped up...still new and the size listed on the package..just taped up because someone else bought the wrong plug. Relax a little...life is too short to stress over a meangless issues.
Thats my 10 cents worth! And I don't work for Radio Shack!

I'd like to trade my 1965 Cobra Cam 88 tube type, 24 channels. (One of the few early units that came with an extra channel).

Recently gone over electronically, although the chassis is a bit gooey and needs a good cleaning. Will go base or mobile with included power cords and mounting brackets. Has original hand held microphone, but sounds great with a
TUG8-D104. The channel knob is not original, but you'd
never know it if I hadn't told you. (blends in real well with the scheme). A few minor blemishes in the brushed aluminum face. Also the S-Meter is a replacement....
It is exactly the same size as the original, but it is black face rather than white face. Has fine tune, squelch, PA/CB, and "Dyna-Boost", (or speech
compression).

I'd like to trade for a nice chrome Vibroplex paddle or similar. I'll entertain all ideas, including swapping for a repair job on my Hallicrafters
SX-24. It needs the four section electrolytic cap in the power supply replaced, and possibly a new choke which I think is what took out the cap to begin with. I have a schematic to go with it, but I'm not talented enough to fix it.

Please email Cary at cfries@tic.bisman.com.

Regards,

Cary Fries

Hi all,

I have a dead FT 2400H and need a parts radio.
Someone has attempted to mod this rig to open up receive.
Unfortunatly - they did not handle the soldering iron correctly. The rig does not power up anymore. I have attempte to fix it but I think some parts are missing and the chips on that board might be toast!
To the best of my knowledge the rest of the radio is fine. I need a rig with the front panel in good shape. I hope to resurect this thing for a friend who really needs a 2m rig. I called Yaesu but they wanted way way too much for this part. More than a new one price! If you got a FT2400 with dead finals or some other problem perhaps we can make one out of the two. Drop me a line k5kip@wanweb.net
Thanks all!
I need the front panel intact and intact.

From: Floyd Sense <sentek@sprintmail.com>
Message-ID: <7flv76hrb1@ash.prod.itd.earthlink.net>
Source record: 110283

I need an HQ-170A schematic, or at least that portion that shows how the 6C4 oscillator tube filament is handled. I believe that a change was made from the HQ-170 whereby this tube, and possibly one other, received filament power to minimize drift even when the receiver is turned off. Haven't been able to locate a 170A schematic online. Can anyone help??

Ooo, I get to show off what I learned asking the very same question last week! The -A comes with the digital display (and general coverage Rx) standard. It also has some filters (ssb and cw) as standard. I believe that is about it. There may be other minor things. I got here by standing on the shoulders of giants. Thanks to all who took the time to enlighten me.

Interesting: and probably quite effective. How come others don't do
that also? I've looked at some older radio specs, and some of them had
recieve attenuators. Oh well. Now that I don't live in a big city,
intermod is not that much a problem for me--other than computer noise, I
don't have noise problems.

1944. Re: Yaesu FT100 Problem

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-21 00:00:00 UTC
From: The Radio Clinic <wr2i@access1.net>
Message-ID: <371e795e.0@news.access1.net>
Source record: 110293

Jim,

Most VHF/UHF mobiles and portables have extremely relative "S" meters. I would bet that the FT-100 has an "S" meter that is calibrated to 10 uV=S9 and 50uV= S9+60.

If I were you, I'd check the VHF/UHF sensitivity using a sinad meter rather than the "wife down the street with a 50 mobile" test before calling for help.

Need a set of GE ICOMs on a 444.xxx MHz Tx / 449.xxx MHx Rx frequency pair for MASTR II repeater station. Actual frequency isn't important, these are just for tune up, but need to already be in the 70cm amateur band. Or, I can also use crystals only (for 2C transmit and 5C receive ICOMs). I am waiting for a frequency coordination and don't want to purchase a new set of xtals just yet...

If you have anything let me know...

73,

- Seth N6BMB

Hi Barry, great name. :)
Do you think you could put some punctuation in so that we
can take a breath while reading your text?

What frequency is the pager on? You might be able to use a
tuned length of coax connected as a tee. I forget the details
but it is supposed to act as a notch filter.

1959. NEW VX-5R's $$345 delivered

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-22 00:00:00 UTC
From: advanspec@aol.comburger
Message-ID: <19990422092547.23817.00000036@ng138.aol.com>
Source record: 110127

As of today (4/22) we still have in stock a few brand new Yaesu VX-5R's at
$345 pick-up or DELIVERED cash or credit card.
http://home.att.net/~advancedspec/advanced.htm
Advanced Specialties 1-800-926-9426 201-VHF-2067
Authorized dealer New Jersey's Communications store
Also new in stock Nickle-Hydride 5W batteries for Alinco DJ-190/191/G5T

1960. Re: Alinco DX77T Comments? Opinions?

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-22 00:00:00 UTC
From: John Dewey <jdewey@tribune.com>
Message-ID: <7fn8l6$nu15@news.tis-in.trb>
Source record: 110128

I bought mine in July.
CW filter and if shift work. Noise blanker WILL distort signals under some conditions, a common complaint seen here.

Undocumented jumper inside radio, allows bias for electret microphone. It is on schematic.

I am running mine on SSTV and PSK31. At full out, the heat sink gets hot, but radio keeps running. I cut back to 50 watts cuz I am a chicken.

I am using Log-eqf program to talk to radio on serial link. I have also used Hyperterm. NOTE 2 (minor) errors in programming manual.

For details on radio operation, down load Progaming manual (.pdf) from alinco site. It covers allmost all radio functions, as almost all functions can be performed by the serial link.

If I did much mobile work, I would buy another one and leave it in the car.

Yep:

I am looking for onr of these old E-Prom Programmers for the Older (More Obsolete) Series Uniden Mobile Radios. Perhaps you have a Series A or one that has been modified to a "C"..Also looking for any (All) adaptors. I here there
were a couple of them.

If you have one of these collecting dust in a Garage or Shelf, and wish to turn it into some Motorola Radios or Portables, Parts and/or supplies, Please contact me with what you have. Also looking for the later Model AMX501 too.

If all else fails, there is always Cash.

How about that, that's what the manual says. But it isn't true for
all Icom HF radios. In the IC-735 service manual, it specifically
says to turn the preamp off to calibrate the S meter. You still
can't get it to read 6 dB per S unit, however.

1985. SSB module for VX-5

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-22 00:00:00 UTC
From: "Jose R. Camara" <camara@quantacorp.com>
Message-ID: <371F63B9.FDED55E5@quantacorp.com>
Source record: 110153

I still have to look further on this, but it seems that SSB reception is already designed for the VX-5, by Yaesu. Here is why:

1. On the display I've seen 'SSB' instead of NFM,WFM,AM once when playing with the clone data. It could simply mean that the firmware is shared among several radios, though, and I never thought much of it.

2. I was looking at the service manual (which has a more accurate schematic than the 'consumer version', unfortunately) and I noticed that the connector that takes the bizarre barometer sensor also has a 'pitch' (pin 10) and 'beat' (pin 8) signals. Pitch connects to APC, and D/A analog signal from the CPU that normally controls the TX power level. It is probably used to control the BFO frequency from the CPU. Beat is connected to AM, goes (indirectly) to pin 7,12,13,14,20,etc of Q2005, TK10930V, which is the AM/NFM chip.

If anyone can find a datasheet of the TK10930V, or at least find out who is the maker, it could be helpful to find out what kind of beat frequency it needs in such configuration. BTW, anyone with a datasheet for the FQ7925 (pll freq. synth.) would also help a lot.

It seems that simply a cheap VCO taking Pitch as input, 3V supply and sending it out to 'beat' would allow SSB. If Yaesu plans it as a later add-on, a second boost in sales (like the ebhanced keyboard as default in the ft-50rd), or a whole new model (vx-6?) is unknown.

Experienced, genuine HAMs can start designing this VCO, I'll try to find out if a jumper or whatever signal in that connector tells the radio to enable the function. Maybe simply the existence of the oscillator output, as the 'Beat'/AM signal goes also to the CPU.

So here is a way of injecting the beat oscillation other than trying to go through 1/16" of aluminum.

Hopefully, now that we found out about it, Yaesu will release the SSB module earlier. It is a shame that early adopters of their radios always seem to get all the problems, but also have the privilege of paying more for a leass featured submodel. Early bird catches the bugs, right? Well, that is the cost of not having patience to wait...

Regards,
Jose

Jimmy, after reading all the follow ups on the ng, all seem to say roughly the same thing that I was going to :)

Another thing to do would be have a look with DajaNews for FT8100, that might tell you of some problems/good
comments said about it ?

I have had one, - sorry, two ! - since last Christmas. The first one went funny on VHF, wouldn't R/TX _suddenly_ !
Sent it back twice, couldn't find anything wrong first time, still faulty when I got it back :(Sent it again,
they found something :) Got it back, still the same :(TOOK it my self ! They changed it :))

This one seems to be fine, - so far ?-)

Very happy with it, wouldn't have bought it if I hadn't though it was some good :)

Well, it's not plug-in, but it is a piece of cake to install in the radio. I
put one in my 706 and it works great.

I am considering the purchase of a "Brute" model
HF amp for conversion to 6 meters. It runs a pair
of MRF 412's.

The MRF 412 does not appear on the Motorola
on-line specifications site.

Is this device suitable for all-mode use to 150 watts
or better (as a pair with 10-15 watts drive) on 6m?

Thanks! & 73,

Howdy Allen....Ref your 3kw marine radar installation...keep it ABOVE the heads of anyone passing by by a few feet if possible. Marine radar has a vertical beamwidth of 3-5 degrees (high intensity area) and is offset from roughly the horizon (at the scanner) downwards this amount towards the sea surface. All this of course is relative to the vessel deck. Don't worry at all about placing people in the path of the pulses...just DON'T do it. Happy sailing.

Gord

You didn't say what the battery voltage was, but two volts on the IFs sounds a lot lower than what would be normal for a 6 or 9V transistor radio. Maybe a cap turned into a low resistance?

We're having our annual art show in the lobby of our art building and the artists have set up a few exhibits. These artists have caught contraptionitis! One has taken a gas powered weed whacker apart and assembled it to look like a frosty snowman. Another has used fan belts, alternator rotors, pulleys and shafts from whatever, and a 1/4hp motor to make an animated contraption.

But the piece de resistance is the, um, I don't know what it's called. It's three TV antenna booms with most of the elements missing, and they are propped up into sort of an easel. From these arms, there are more than a dozen home electronics things fastened and some are running. Answer machine, intercom, clock/radio, couple telephones, a couple old portable radios, an old portable b/w TV, and the really wildest part, a couple turntables, turning, with a spiral of shiny metalflake stick-on to make your eyes play tricks on you. It's really the weirdest contraption I've seen!

2012. Recommendations for cross-band repeater capable mobiles

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-22 00:00:00 UTC
From: Jeff Hamilton <jhamilton@airnet.net>
Message-ID: <n39lyVTj#GA.239@newstoo.hiwaay.net>
Source record: 110180

I'm in the market for a 2m/70cm mobile unit capable of cross-band repeater operation. I know the Kenwood TM-V7A can do this. How well does it work? How well does it reject intermodulation distortion? How does it compare with other dual band mobiles, regardless of whether they are cross-band repeater capable?

FS 2 Swan 270B xcvrs

#1 is VGC a minor scuff on face and all good tubes. Works on all bands. Original knobs with aluminum brights. Looks about 8+ out of 10. With copy on manual.
Asking $145 plus shipping

#2 is in fair condition, face is good. Cabinet is fair. Radio plays but needs a little help. With copy of manual. About 6 out of ten.
Asking $90 plus shipping.

All reasonable offers considered.

Thanks

Butch

>Also, I find the spectrum scope in the 756 very useful in contesting.
>Since the 746 spectrum scope does not work when you are actually
>listening to the signals, to me it is useless.
>>

I use the 746 for all kinds of stuff, including swling the vhf bands, and the spectrum scope is handy for scanning around looking for signals, even if it doesn't receive during scan.

Ron, I saw the FL232 and figured it was a good compromise if I was just
going to buy one additional filter. It's 350hz, usable for both cw and
rtty, and I like it a lot.
I don't know about the relative advantages of 9mhz over 455khz filters, and
hope someone can elucidate a bit.

Source record: 110301

Shawn Upton <supton@eece.maine.edu> wrote:

:Fred McKenzie wrote:
:
:> The problem you describe is most likely the result of intermodulation
:> interference. Two or more strong stations on other frequencies, combine
:> inside the radio to produce a signal that is on the frequency you are
:> listening to. The "screeching" signals from paging transmitters are more
:> likely to cause it, because they are usually running several hundred
:> watts. When you use a magnet-mount antenna, signals are stronger than
:> when using the rubber-ducky, so the problem is made worse.
:>
:
:Makes me wonder why the manufacturers don't put some sort of recieve
:attenuator in their radios--most 2m fm work is done on the repeater,
:some done simplex, but usually with strong local signals. The radios
:have so much gain that they are bound to have IMD problems. Pop in a
:20dB attenuator on just the recieve side, and I wonder how that would
:affect this intermod problem that is so common to hear about these days
:(with wide rx radios, that is).

Wide range receivers used to have tuned front ends. I suppose that
adds too much to the cost.

What frequency are your pagers on?

-Where can I get information on building my own EVE / ADMS cable?
-How can I contact YAESU?

==========

Q: Are their any Modifications for the VX5R?
A: Yes, Please go to http://www.icongrp.com/~sllewd/vx5rmain.html .

Q: How do I erase digits in the Dialer memory?
A: You can delete the remainder of the DTMF register by pressing the
[MON] key (below the PTT) twice. In the example
given, you would enter [1][2][3][4][MON][MON] and
[PTT] to exit the programming mode.
"Pressing [MON] once will enter a hyphen. This is cosmetic only and
does not alter the transmission of the DTMF tones

Q: How do I change the Priority Channel designation
A: To change the priority channel, in the memory mode, change to the channel
you with to "prioritize", then press and hole the F/W button, and then

press Band(Set/AR). Your new priority channel should be set.

Q: Edge Beep is not working, how do I activate it?
A: Edge Beep is disabled if Key Beep is turned off
If Edge Beep is enabled while in memory scan mode a beep is heard each
time it wraps around from one end of the memory list to the other.
Scan Beep is disabled if Key beep is turned off. Scan Beep is not
mentioned in the manual at all. When stopping on a frequency or memory
channel while in scan mode a short beep is heard.

Q: Does the VX5 have a real time clock for the timers?
A: The power on and power off timer is reoccurring. So if you set it for 10

minutes it will turn on/off every 10 minutes until you change it.

Q: How do I convert Celsius to Fahrenheit - Inches to Millibars?
A: Temperature Fahrenheit = Temperature Celsius * 9 / 5 + 32
Feet = Meters * 3.28 / Inches = MB / 33.682 I set a memory channel with
Frequency 3.280 Label T*9/5+32 to help me remember.

Q: What are the Items stored in a memory channel
A: Frequency Power Level03, Name 04, Memory Icon 07, Repeater Shift08, Shift

Amount 11, VFO Step 28, Clock Shift 29, Squelch Type 30, CTCSS Tone 31,
DCS Code 36, Receive Mode 38, Half Deviation

Q: How do I reset the Usage Timer?
A: To reset the Usage Timer While usage timer is displayed FW (1 sec), 6

Q: How do I test the LCD display?
A: Hold [VFO] and turn power on: LCD pixel test/ LED test.

Q: How do I do a "Set Mode Reset"?
A: Hold [MR] + [VFO] and turn power on to enter 'Set Mode Reset' .

Q: Are there shortcuts to naming "labeling" a frequency
A: When you want to name your frequencies, instead of wearing out the
radio's tuning knob, you can get 'close' to letters by hitting [TXPO].
Make a mistake or decide you don't want a letter in that spot? hit [MR]
and it will erase the character the cursor is on.

Q: Frequency name with two of the same characters sequentially?
A: Don't use the thumb wheel, just hit[HM/RV]

Q: Can I power the VX5R from my Vehicle?
A: Yes you can. There has been some discussion about interference,

alternator hum, but I believe its minimal.

Q: Do lithium-ion batteries need a "break-in" period like NiCad,
where they need to be charged a few times before they reach Max capacity?
A: Yes, Normally After 3 times they are at their peak. Go check out
http://www.cadex.com/cfm/index.cfm for more information on Battery's.

Q: I cannot enter 52.525 on my VX-5. 5 2 5 2 5 results in 525.25 and 0 5 2 5

2 5 results in 52.52 - it will not allow me to enter the 5.
A: Set your step to 25 kHz. The radio will then accept 052525.

Q: Will it damage the radio if I leave the extension on and transmit in the

2m / 70cm Range
A: According to Yaesu Tech Support. They said that you will not hurt the
radio if you leave the extension antenna on the radio all the time. Now
others have said that their 6m receive is better with the extension
antenna on and their 2m/70cm receive is worse.

Q: What exactly is the difference between a NiCad battery and the Lithium-
Ion one that comes with the VX-5R?
A: Well Lithium Ion batteries are smaller, lighter, and don't have a memory
affect like NiCads. Also, I believe the way they are charged is
different, so I wouldn't try charging them with a Nicad Charger.

Q: How do I get a updated Manuel?
A: You can either call or E-mail the Yaesu Parts Department (See How To
contact Yaesu at the bottom of this FAQ) Give them your name
and mailing address, and a new manual will be sent to you free of
charge.

Q: Is there any way to enable 16-48 MHz or the 800 and 900 MHz holes in coverage to receive?
A: No, Not at this time.

Q: Where can I get a SMA to BNC adapter?
A: Gateway Electronics, Only cost $4.60. Look them up at www.gatewayelex.com for information.

Q: What frequencies are blocked on the VX5R.
A: 16-48.000MHz
728.995-800.000MHz (What's there?)
823-849.000MHz
863-894.000MHz
917-944.000MHz (Cell Phone Image?)
962-989.000MHz (Cell Phone Image?)
Are all blocked. So far there's no way around it.

Q: The DTMF tones for my numbers 0 through 9 do not sound,> however the #, *, A, B, C, & D do.
A: I will wager there is a small picture of a telephone displayed near the bottom of your screen. This means you have DTMF auto dial turned on [F/W] , [3] will toggle it on/off. I'm also guessing you haven't programmed any Auto dial memories and that is why nothing happens.

Q: I have the loose antenna connector? Is there anyway to fix this on my own permanently?
A: I would locate an SMA jack nut wrench; maybe try your local (friendly)2-way radio shop. Tighten the locking nut firmly. You could also try some tweezers.

Q: What is the EVE software? What is it? Where does one get it?
A: Eve Software is used for Programming the VX5. You can upload / download Frequency's. One of the nice features is that you may use the virtual jumper and modify the radio to transmit on more frequency's. You can get it at http://www.geol.com/vx5/ has most the information.

Q: CTSS seems to take a long time, is it supposed to be like this?
A: No, This is a reply from Yaesu Technical Service :

Yaesu Technical Support wrote: Thanks for the email. We are aware of the CTCSS problem your having> with your radio. There is an update for the CTCSS decoding. If you can> kindly send the VX-5R to us for warranty repair, we would be happy to> correct the problem and update the VX-5R to factory specifications. We are> located at Yaesu USA, 17210 Edwards Rd. 2040. Will Trade Halicrafters S41W AM/SSB/CW tube receiver for business VHF radio

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-22 00:00:00 UTC
From: jmtsr@usa.net
Message-ID: <3720a2fe.9451967@news.blueridge.net>
Source record: 110310

I will trade a Halicrafters S41 W AM/SSB/CW receiver for a business VHF radio that outputs 35+ watts, Motorola perferably Doesn't matter about how many channels, programable unit preferably. Must be able to do simplex on 155.085. The Halicrafters receives from about .5mhz to 30mhz. Receives incredibly good, metal shell in fair shape, no dents, all tubes good. Creamed colored with huge lighted dial, wooden tuning knobs are original. Very 1950'ish, but might be later. Great antique piece. I must talk voice to seller before shipment.

2041. Trade DSP-59+ for 35 amp pwr supply?

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-22 00:00:00 UTC
From: Steve <steve.w3sy@erols.com>

Source record: 110311
Cross-posted to: alt.ham-radio.marketplace,rec.radio.amateur.equipment,rec.radio.amateur.misc,rec.radio.swap

I have a very nice Timewave DSP-59+ that I am willing to trade straight up for a good 13.8 Volt 35 Amp power supply. Unit is in excellent condition and works well. Will even toss in power pack. Includes original box and manual.

I have a Kenwood TS940SAT for sale. This radio is in excellent condition.
It has all the filters installed. No mic/keyer is offered with this radio.
I am asking $850 and shipping for it.

For pix of this radio, go to:
http://www2.fwi.com/~ww6q/ts940/ts940sat.htm

Serial Number = 8010057

For any further questions on the rig, write to me at ww6q@fwi.com

73 es Thanks

Roy / ww6q

2046. Kenwood TM-241A PL Tone Problem

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-22 00:00:00 UTC
From: w2ade@my-dejanews.com
Message-ID: <7fn0ng$6ci$1@nnrp1.dejanews.com>
Source record: 110316

One of my two Kenwood TM-241A's gets me complaints of excessive PL tone that's affecting my audio, when the PL tone is switched on. My other radio doesn't have this problem, but there's another TM-241A in the area that has it to an even greater degree than mine. Reducing the deviation by turning down VR3 doesn't help- it reduces the audio as well as the PL tone. I cleaned off a lot of solder flux around the microprocessor and D to A converter R246, but that had no effect.

Any suggestions on how this can be fixed?

Thanks and 73,

Howard

2047. Cirkit 23cms converter-HELP!

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-22 00:00:00 UTC
From: al@boltons.demon.co.uk
Message-ID: <371eff35.6223132@news.demon.co.uk>
Source record: 110317

Hello all,

I have a Cirkit 23cms converter (with 10m I.F.) which has worked quite well for a number of years (I bought it as a kit in about 1985).

Unfortunately, it looks like the RF amp device has failed and it is now extremely deaf!

Does anyone have the circuit diagram/parts list or even a built version they would like to get rid of? I'd like to get it working again (it was my first working bit of kit for 23cms) but I no longer have the circuit diagram.

Alternatively, I believe the design was published initially in Radio and Electronics World in the early 80's and I'd be pleased to pay for a photocopy of the article.

Thanks!

>73, Fred, K4DII

The IC-706 series,as most of Icom HF radios, meets the published
receiver specifications with the pre-amp turned on. When the pre-amp
is turned off the receiver specification is undetermined and
undefined.

2055. Re: Responding To Illegal Swatch Co. 2m Broadcast

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-22 00:00:00 UTC
From: Erik Karlsen <erikkarlsen@coolmail.com>
Message-ID: <7fn6q3$kei@newsops.execpc.com>
Source record: 110325

From http://www.wired.com/news/news/technology/story/19185.html
---
3:00 a.m. 17.Apr.99.PDT
Swatch has abandoned controversial plans to beam marketing messages from space. The company claims that it's because the satellite's batteries were donated to the MIR space station. As previously reported, Swatch was intending to broadcast a series of advertisements from an amateur radio satellite launched from the Russian MIR space station.
Swatch called the battery-operated mini-Sputnik-99 satellite "Beatnik," a play on Sputnik and beat, the unit of Swatch's proposed Internet Time standard.

Swatch hoped to use the Beatnik satellite to beam down a series of messages containing the word "beat" via an amateur radio channel designated as commercial-free by an international treaty.

But the proposal outraged ham radio operators, the only ones in a position to pick up the broadcasts. A boycott was arranged and Swatch was bombarded with protests.

According to a full-page advertisement in newspapers Friday, the project has been cancelled because the Swiss watchmaker donated the satellite's batteries to the crew of MIR to help run a critical communications uplink.

The ad, which ran in Friday's New York Times and Los Angeles Times, purports to be from the Russian Space Agency thanking Swatch for the batteries.

The ad says that a key communications link with MIR was severely damaged a few days ago, making it difficult to communicate with the space station.

But Swatch stepped in and donated batteries from the satellite to support an alternative communication's uplink that will be used to deliver daily instructions to the station's cosmonauts.

"To thank Swatch for this gesture, we have decided to publish the messages that had been recorded ... and that we are now not able to transmit on the radio waves," the ad says.

The ad lists some of the messages originally scheduled to be beamed from space.

In a press release sent out Friday morning, the Swatch boycott organizers claimed responsibility for making the company back down.

"I think the response from the amateur radio community had to have made a difference," said Rob Carlson, a radio ham who organized the boycott.

Carlson said that there was some doubt about the truth of Swatch's claims. He also said it is questionable whether the batteries were Swatch's to donate in the first place.

"As far as I know, the satellite is the property of AMSAT France and AMSAT Russia," he said. "The components of the satellite don't belong to Swatch. How they came to think they could donate them I don't know."

Swatch couldn't be reached for comment. However, at the bottom of the Web version of the ad, the company acknowledges friction with the amateur radio community.

"There has been a lack of understanding between us and some of you have been very aggressive regarding the transmission of these messages. It was a real shame!" the page says.

"Now that this situation has been resolved, we would like to invite you to take part, with us, in this cyberspatial mission, spreading these positive messages all over the Net."

2056. Linear ALC and Relay Connections

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-23 00:00:00 UTC
From: Marv Luse <mwluse@dimensional.com>
Message-ID: <3720A043.9BE0E397@dimensional.com>
Source record: 110077

Hello,

I just purchased my first-ever linear, an Ameritron ALS-600, to go with my Icom IC-746. Does anyone know if the ALC and relay connections of these two are compatible? From reading their respective manuals it would seem that they are, but because of my inexperience with linears I'd like to get a second opinion. Don't want to fry something if it can be avoided.

The Ameritron ALC will function with negative voltage control systems requiring less than 10 volts, the 746 produces a 0 to -4 volt ALC voltage.

The relay circuit descriptions are a bit confusing to me. The Ameritron's provides a 12 volt open circuit and supplies less than 100 ma when pulled to ground. The 746 manual states that the send relay specifications are 16V DC @ 2 A. Am I okay here?

Thanks for the input.

73,

Marv

There were earlier msgs re modifying the microphone, by removing some of the internal foam or some such thing; just looked and I do not have the messages saved. Also:

1) I suspect the ALC reads low on the 706MkII; seems there was an Icom msg to that effect; you may be getting more audio than you think.

2) Use speech processor/compressor.

A co-worder I know used to do govt research in RF systems--said that their studies found that the the older AMPS syste'ms frequency achieves resonance in a cavity with the exact size/dimensions of a human baby skull.

Of course this means that the skull would act as an antenna and heat and related effects would increase acordingly.

Message-ID: <7fqndckej1@birch.prod.itd.earthlink.net>
Source record: 110089

If you are referring to the mike problem experienced by many - then try a different mike. I use an Sm-6 and everything is fine. It was not fine with the handmike that came with the 706 MkII.

2074. Re: MRF 412 Specs?

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-23 00:00:00 UTC
From: Gord Skiffington <skiffing@nbnet.nb.ca>
Message-ID: <37211ED1.507D@nbnet.nb.ca>
Source record: 110095
Cross-posted to: alt.ham-radio.vhf-uhf,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Howdy Dave.....I too didn't find the MRF412 specs but came up with some ballpark figures based on cross reference to either the NTE317 or ECG317 for the MRF412 and to the ECG334 for a MRF412A

NPN-Si, RF Pwr Output (Po 70W, 30Mhz) BVcbo 36
BVceo 36
BVebo 4
ICmax 15 amps
PDmax 220 watts
Hfe 10 minimum
Case RF-50F

The '334 is a little lighter rated at 60W 14-30Mhz and 175 watts PDmax with same Hfe of 10......Case is a RF-38S

I looked the MRF412 up in my Motorola RF devices manuals (all volumes) and you're right it doesn't show so is likely made by someone else (or is newer than my books).

Hope this helps a little......I'd guess that for 50 Mhz operation you'd likely have to settle for a lot less gain....might not be in the desired power output range you are looking for.

73 - Keep on Tinkering.....THAT....is REAL HAM RADIO!

Gord - VE1AJF

For Sale:

A 1965 Cobra Cam88 CB, has the old channel which was referred to as "B", but which was actually channel 24. The rig has recently been gone through to the tune of well over $150.00. The chassis looks a little gooey to me and could use some cleaning up.
The channel knob is not the original, but it fits in very nicely with the scheme of things...you'd never know Otherwise. The S-Meter is a replacement, however it is EXACTLY the same size as the original except with a black face. The brushed aluminum face has a few minor flaws....nothing too terible. All the lettering is very good.
Comes with original Mic; from what I can gather, it is an Astatic hand held contracted by B/K, Output is near 4 watts. Modulation is very nice with a Tug8-D104.....punchy yet mellow. It has built in switchable speech compression; Cobra calls it "Dyna-Boost". It has power cords for both 13.8 VDC and 110 AC,

Also, I have a 1960 or 1961 Demco Power modulator. It's essentially a two tube preamp for use between the mic and mic input. I suspect that there is some collectablity factor here. It's missing the two tubes, and I'll be damned if I know what they are. I'm sure a Riders book could settle the score quickly. I can assure you this unit was working properly before I decided to salavage the tubes in all my pubescent pomposity. (duh) It'll need the proper amphenol mic connectors to be useable.

Also, I have a Cobra SR 900 16 channel scanner in fair cosmetic condition with with three preset NOAA freqs. It's operated from a 12 volt power adapter. It has an external antenna output Obviously, this is a primitive item, and might be good for the casual listener. I'll throw in the last two items if we can come to terms on a mutually satisfactory deal.

For Sale: Uniden pro 500B 40 channel CB. This is a gimme too.....I'll make you a great package deal. (I think it was 40.00 new!)

Now for something completley different, any call for THESE odd balls? I have two mint woofers for the JBL Model 4401 Control Monitor speakers. They appear to be 51/2" from surround to surround, or 61/2" from one end of the brushed aluminum frame to the other. The speakers are mint with heavy magnets, rubber surrounds, and white cones. These origianlly served in radio monitor
duty, but the moronic jocks insisted on driving the weasely amp just past the point of distortion and subsequently turned the tweets to toast. You can have them naked, or I can ship with the cabinets, your choice. The cabinets are in pretty fair shape.

If you'd like to know more, Please email me cfries@ tic.bisman.com

The following equipment is for sale.

1: TH-D7A Dual band HT, this HT is 1.5 month old.
In brand new condition, I have all manuals and
boxes. I made the computer interface cable, used
for little more than a month on APRS.

$350.00 Firm does not have the kenwood upgrade
Payed $447.00 new

2: GSP globalMap 100 by Lowrance
I have mobile power cable and computer interface cable.
Comes with windows maping software, unit has build in flash
memory for downloading local maps. Unit also has build in
national highways.

$350.00 purchased in November of last year for $500.00

3: HP Spectrum Analyzer with 141 T display 8553B RF Section
And 8552A IF Section.

$250.00 O.B.O

4: Kam almode TNC HF/VHF older model with manuals and wall power supply.
$150.00 O.B.O

5: Radio shack Pro 2036 scanner with power modual and no manual. Works like
new in like new shape.
$150.00 O.B.O.

I'am selling to purchase new HF equipment, you may make offer
on HT and GPS.

2097. Re: Japanese Screwdrivers???

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-23 00:00:00 UTC
From: estraven@my-dejanews.com
Message-ID: <7fok0pmma1@nnrp1.dejanews.com>
Source record: 110198

The proper term for these screws is ISO metric, denoted by the little punch mark on the screwhead to one side of the screwdriver slots. Pozidriv screws (found typically in HP and Tektronix test equipment) are another pattern again, and have sort of a cross-mark superimposed on the screwdriver slots.

OK, enough blathering, now for stuff you can use:

Jensen Tools is a good source for all things strange and wonderful in the world of screwdriverdom. At least, that's where I got my ISO metric tools. Thanks to them, I no longer tear up the screwheads on my ICOM radios anymore.

regards,

Mahlon - N4EEE

Icom's (IC-706) seem to suffer from the same malady. Must be the price you pay for so much coverage. It helps greatly to turn on the pre-amp when using VHF or above.

2103. Ham Resources, Swap Page Updated

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-23 00:00:00 UTC
From: ki0dz@juno.COM
Message-ID: <19990422.205930.-510383.0.ki0dz@juno.com>
Source record: 110204

Both of my Amateur Radio Resources and Online Swaps pages have
recently been updated. Changes to the Amateur Radio Resources page
include adding broadcast and YL sections, also updating the packet radio
section. Non-functioning sites were removed from the Online Swaps page
and two new ones were added. I believe that the Online Swaps page
contains one of the largest collections of ham-related e-swaps on the
net.
I am in the process of "polishing" up my entire site, with attention
to updating the information contained and deleting broken external links.
Feel free to revisit it to view improvements. The address is the
QSL.NET address in the sig file below.
I am always looking for additions to both of the above-mentioned
pages. For the Amateur Radio Resources page I am specificially looking
for an entry for each of the following subjects: EME, satelite, 6M,
meteor scatter, contesting, NTS, and antennas, (what am I missing?).
Please let me know if you are familiar with a page that would be an
asset.
Thank you and enjoy your "stay."

2110. TS950S/ALS600 Can't get full power output

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-23 00:00:00 UTC
From: Sugar Bear <mister_blonde@hotmail.com>
Message-ID: <372038E2.1374E3DC@hotmail.com>
Source record: 110211

I have a TS950S connected to an ALS-600
an ATR-15, and a dipole antenna on 10,
and 40 meters. When I run the setup on
stanby, (barefoot), the 950 can be tuned
for maximum output. When I switch in the
ALS-600, the 950 goes down to 70% hence I
can only get 240 watts on CW, swr on 950
is 1.5. I suspect
the automatic antenna tuner in my 950 is
defective. Might this be the cause???

Best Regards... ... Sergio.

2113. help! TS-850 pll unlocked on 160 and 75

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-23 00:00:00 UTC
From: turner@rome.ics.uci.edu
Message-ID: <9904222256.aa07356@paris.ics.uci.edu>
Source record: 110214

Hello all -

I found my 850 was displaying frequencies on 75 and 160,
but actually transmitting on 4.3 and 2.3 MHz instead of
3.8 and 1.8. Not a good thing at all :-) .

I also note that the antenna tuner acted strangely, but
that may make sense if the signal was not in the expected
band.

When I transmit into a dummy load to find the frequency
using CW mode and lowest power setting on 75 meters, I
get "UL" in morse code from the rig and the display goes
all dots.

Everything seems to be OK on 40 and above.

Anyone seen something like this? I cannot get very
involved inside the rig at this stage with my current workload,
but if it is simple I might take it on. Otherwise,
I'll send it out, but curious if anyone knows what happened
to me.

The 440 comes to the top of the bench.

Once the segment .1-8MHz on my IC-735 was getting noisier and noisier, and eventually stopped working at all. I unsoldered the PLL cage (took a long time), tapped a trimmer that adjusted the .1-8Mhz range, and everything worked fine. It is possible that something similar is going on with your TS-850. If you don't have time and patience, sending your rig for service may be the best idea.

From: Oris <oris@dirtball.com>
Message-ID: <37207573.E4F@dirtball.com>
Source record: 110222

Hello all
I have a Dentron Clipperton L forsale. It has new 572b's new band switch and all of the Capacitors and diodes have been replaced. I have schmatics too. The amp is wired for 220 with 100 watts drive 1200 watts out on 80-meters. The band coverage on this amp is 160-15. I'm asking 500 bucs plus shipping. If you are interested drop me a line.
oris@dirtball.com

The Onelist listname is YaesuVX1, but there hasn't really been any
activity there since March 29.

I don't know if you know, but there is some really good
information at:

http://www.icongrp.com/~sllewd/

I subscribe to the YaesuVX1 and the YaesuVX5 mailing list. It seems
that there is alot of discussions going on with the VX5.

Good luck...

DKBMC, My opinion is that the 920 HF/6meter rig is the best buy for the money right now because of all the bells and whistles on it.. digital audio recorder, dsp ect.....They are giving away the FM board with the 920's now so if you buy a used one make sure you get the FM board with it. The used price on these rigs go from $ 900.00 to $ 1,200.00
Just remember one thing.. Cheaper sometimes is not Better...
Buyer Beware...
Good Luck with your purchase

2136. Equivalent wanted for NE21936 transistor

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-24 00:00:00 UTC
From: al@boltons.demon.co.uk
Message-ID: <37216f68.1329784@news.demon.co.uk>
Source record: 109989
Cross-posted to: uk.radio.amateur,rec.radio.amateur.equipment

Hello,

I need a replacement RF Amp transistor for my 23cms converter.

The faulty device is an NE21936, made by Nippon Electric in the early 1980's. It has 3 pins, runs on 10-12V, good to 2 GHz maybe. It's also Bi-polar.

Can anyone help me find a replacement OR a better modern equivalent as I am desperate.

Thank you,
Al Bolton

Well, the thing is it is off freq. by 5kHz. And I called Kenwood
and they want $50 per hour labor + parts to fix the thing. I thought that
I would see if anyone else has had this problem etc... and maybe can help,
or have some advice. Please let me know if you can.... either post it
here, or E-Mail me at one of the below addresses.... thanks.... Oh yeah..
the HT is 5kHz high... meaning to listen to 146.52 I have to tune to
146.525.....

> voltage.

That sounds fine, but note that it is the amplifier that produces the
ALC and it is the tranceiver that receives and responds to this line.

> The relay circuit descriptions are a bit confusing to me. The
> Ameritron's provides a 12 volt open circuit and supplies less than 100
> ma when pulled to ground. The 746 manual states that the send relay
> specifications are 16V DC @ 2 A. Am I okay here?

Again the specifications sounds safe, but on this one you need to ask
whether anyone has had bad experiences. You do not want any arcing
or burning of the tranceiver's relay contacts as that repair will
mean absence of your set and significant shipping and labor expense.
Unless you get a definite okay from other users, it's simpler and it
will be easier on your sleep to simply insert an intermediate relay.

Good luck with your new toys :-)

bedard@banet.net "Larry Bedard" wrote:

> Just wondering if anyone out there has any comments about the Yaesu Quadra
> amp, likes dislikes, power output, etc. Would an Alpha 87A be a better amp
> considering the extra $2000 more?

You'll get some more power for those $2,000, but you'll lose 6m and need to wait around 2 minutes after powering the 87A up to allow the 3CX800A7's to reach their safe operating temperature. Also, if you already have a Yaesu rig, I believe that you'll find the tuning totally automatic with their amp simply by changing bands and tuning the tranceiver while the 87A will need to sniff some drive RF and measure its frequency before automatically recovering the appropriate pre-settings. I'd guess they'll both hold up their values very well.

You'll have to decide what's the "better" amp for your situation.

2145. IC706 Amp Interface

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-24 00:00:00 UTC
From: Jack Schuster <w1wef@snet.net>
Message-ID: <3721F237.A168B649@snet.net>
Source record: 109998

Interface your ICOM 706 (any version) to any HF/6M amplifier with my neat little interface. Just plug it into your accessory connector on the rear of the 706 and run a cable from the isolated phono connector to your amp relay. ONLY $29 plus $3 s&h Jack Schuster W1WEF 408 Thompson St, Glastonbury, CT 06033

Source record: 110005

Hi, I have a Dentron DTR-2000L amp for sale. It runs an 8877 tube, 1750 watts output with 100 watts drive (into dummy load). Great amp! "like new" ven the chasiss is clean!! The 8877 tube is a great tube, can be bought cheap as pulls from medical equipment, unlike 8874's or 8875's that are an arm and a leg to replace. However the tube in here is boque strong!! Better amp than any pair of 3-500's for sure. I will ship conus for $1200.00.Thanks 73 LOUIS

2153. Mods of FT-50(Only inside Japan version)

Newsgroup: rec.radio.amateur.equipment

I got a FT-50N while I traveled in Japan, which is only for Japan inside version. It has limited Rx/Tx frequency range. Only 144-146/430-440 rages are available for Tx and Rx. I believe the basic circuits are same and only couple of configuration blocked Rx range.

Is there any way to convert to FT-50R as US version of FT-50 ? Or is it impossible to convert to expand Rx frequency range ?

Thanks.

- Dongho.

Download the FT50 porogramming software from this site
http://vlaski.virtualave.net/ The software should allow you to program the radio for USA, freeband or whatever.

LOL

If you would like to check out some of the Canadian prices here is a good web page to check out. They are one of the biggest in Canada. And the lowest prices.

Ayed:

Try attaching your antenna to terminal B: On mine, the internal
connection from terminal A popped off the circuit board and I had
similar symptoms. It was diagnosed by using B instead of A. B worked
fine.

To Access Expanded Receive:

The AT-600 is already capable of wide-banded receive out of the box.
To widen coverage range even further turn the radio on and enter the
menu system. (To enter the menu hold down "F" and press the "0" key.)
hile in the menu system press the following sequence of numbers:
"1," "4," "6," "2," and "3." You do not need to be in any particular item
on the menu for this to work. After entering this sequence simply turn the
radio off and then back on. The receive range will now be greatly
expanded.

2167. Re: FT-8100 comments wanted

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-24 00:00:00 UTC
From: "Joel B. Black" <jbblack@mindspring.com>
Message-ID: <7fssu6$g0r$1@nntp5.atl.mindspring.net>
Source record: 110020

Jimmy,

I just got an '8100 last Wednesday. I work for Alabama Power Company as a Telecom Electrician and my job requires that I go off-road, therefore, I have a 4x4 Suburban. The first radio I had was an IC-2000 that died because of the vibration and shaking that goes on in this truck. At least, I think that is what killed it because it operated fine before.

I decided that I would rather have a dual-band rig because 2m in this area is over-populated. I tried my IC-Z1A dual-band HT, but the vibration was so bad that I could barely see the display.

I'm trying to stress the vibration and shaking so as to make my purchase of the '8100 justifiable to you. After reviewing the Nov '98 QST several times and listening to local hams, I had decided to purchase the TM-V7A "cool-blue" radio. At the time, however, I didn't have the funds and I'm glad!

One day, while perusing eBay, I noticed an FT-8000 for sale. The seller said go and check out the '8100 because they are basically the same radio sans detachable faceplate. I did and noticed that the FT-8100 came with a MIL-STD 810 rating. At that point I was pretty much sold on the radio. I re-reviewed the article in that QST and knew beforehand that I would need an external speaker, but I had that already (remember I tried using an HT). I purchased the radio (along with the separation kit and a Comet SBB7NMO antenna) Tuesday of last week without putting my hands on one. The next day, a ham came by the shop and, would you believe it, had an FT-8100 that I could play with. I loved it! He verified that the audio is low and that an external speaker is required, but he had also enjoyed his rig for the seven months he has owned it.

I have previously owned Radio Shack and Icom radios. I currently own an IC-821H for satellite operation, an IC-229H (with external speaker) in the same type truck that you have, a broken IC-2000H, an IC-Z1A, an HTX-202 (my first 2m radio), and the FT-8100. One of the first things I noticed about the FT-8100 that I liked was the warm orange glow from the display. This is quite unlike the harsh yellowish-orange from an Icom rig. The *only* complaints that I have of the radio is the weak audio (solved problem so it is no longer a complaint) and a desense problem with 70cm getting into *some* 2m freqs. This I solved by turning down my power on 70cm. This is problem I also have with my satellite station but it's 2m getting into 70cm and will require a band-pass.

Jimmy, I didn't mean to give you almost my entire history. Just wanted to give you reasons and observations I have made with my new purchase. Yaesu has done an excellent job with this rig and I would definitely recommend it!

I just bought a Paragon, and on CW, listening on the 250Hz filter, to a CW signal, the BP seems to peak at about 8:00 or so, for a 750Hz signal. I would think it would peak near 12:00 or so. Is this common??

Yep I agree. At $680 from TechAmerica, the DX77T packs an awful lot of radio into very few dollars. My only complaint is that the T/R relay is noisy, but overall VERY pleased. I also have the EDX-2 auto antenna coupler feeding a 150 foot end fed wire. Works exceptionally well.

Message-ID: <372204D1.1BB0C7E9@yahoo.com>
Source record: 110036

Hi,
I have a Kenwood TS-140S that appears to show no ALC action
and output is nearly 200W. Seems to do this on SSB/CW, while
FM appears to be right at the rated 100W.

Obviously, someone has turned something up inside, or, I have
a more serious problem.

Any advice on how to turn down the high power? Which pot controls
that? I have no service manual nor a schematic.

thanks,
Joe K7JOE

Hi all,

I'm sure there must be some truck driving hams out here :))

I'll be going back into cross country trucking pretty soon, and since my wife and myself both have our amateur licenses, I was wondering if there is some reliable method of keeping in contact with each other via ham radio communications.

Cell phones charges would probably cost us a couple hundred bucks a month easily - not an option. The various 10-10 numbers are pretty cheap nowadays, but that would involve (first) finding a phone, stopping the truck (miles are money), etc., not really my first choice if I can avoid it.

Any ideas or suggestions? I'll make whatever initial investment necessary for good *reliable* (any time of the day) communications with the family...

Thanks for any help...

John

Hi John,

I assume you mean via HF frequencies, if you are looking for
cross-country contacts...

Absolutely reliable voice operation, any time of day, is probably not a
practical expectation, especially from a mobile installation. Do you
require voice, or would keyboard-to-keyboard communications be OK? If
so, a schedule using PSK31 would be a good bet - if you can't make a
contact in this mode, then a contact probably isn't possible. Low cost,
too, if you already have a laptop or can come by a cheap one.

PSK31 info and software is available at
http://aintel.bi.ehu.es/psk31.html

2188. Kenwood Items FS

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-24 00:00:00 UTC
From: Ken Simpson <W8EK@usa.net>
Message-ID: <aKrU2.816$Dm3.49901@monger.newsread.com>
Source record: 110041

Kenwood Items FS:

Kenwood VB-2530, Two meter FM amplifier, 5 W input will
give about 30 W out; made to be used with TR-2500, but will
work fine with most any 2 m HT. Includes original manual and
box. BNC connector on input, SO-239 on the output.
Looks and works like new. $ 75

Kenwood ST-2 desk charger. Made for TR-2500, but I think
also works with the TR-2600 and maybe others. This is a fast
charger that will charge a standard battery in about 1 1/2 or 2
hours. It can also be used to power the radio, at the same time.
Runs off of 110 V AC. $ 75

Kenwood MS-1 "mobile stand". This unit is used in the car, and
will charge a TR-2500 or TR-2600, and also power it at the same
time. It is not a fast charger, but since it does not use the HT
battery, it make the battery last much longer. Requires 13 V
DC. It also is used as a stand to fasten it to the door.
Includes a nice little light on it, so you can use it at night. $
35

Kenwood SMC-25 speaker mic for TR-2500, TR-2600 and
maybe others. With original box and manual. $ 25

Kenwood MC-46 TT mic. This mic has a 16 digit TT pad built in,
and is just like the MC-48 that is used on many, many Kenwood
rigs, except this one has a 6 pin plug for radios such as the
TR-7800. It could easily be changed to an 8 pin plug. New mic,
in box, with original paper work. $ 50

Kenwood MC-43 S mic. This mic has the 8 pin plug, and up and
down switches. It is the same mic that comes new on rigs such
as the TS-440, and many others. New, in box, with original
paper work. $ 55

Kenwood TR-2200, 2 meter FM xcvr. This one is an older radio,
and has 12 channel xtal control. It is almost the same as the
Drake TR-22, except it has high and low power. This one looks
almost like new, and includes the soft protective case. Definitely
collector quality. Some xtals included. I have a fairly good
selection, and will try to accommodate your needs. $ 85

Prices do not include shipping from Florida.

Thanks.

73,

Ken, W8EK

Wonderful thought, sure is selfish of some people to force
the noise they listen to into our cars, homes, and ears as we
walk along the sidewalk ... would love an audio-triggered one for
my front yard as well (quiet the passing noise boxes) ... probably
illegal though ... and imagine the amount of power it would take
to inductively-couple an overload into distant circuits?

... forget small ... :-)

We have seen on TV that the Russians, and we Americans,
are racing to develop radar-pulse weapons that disable the
electronic ignitions and communications on military vehicles --
from a distance (ground vehicles and low-flying helicopters),
so I suppose the technology is there ... but consider the risk ...
what it would take to disable the car-boom-boxes might also
car the car to stop suddenly or act eratically and cause a deadly
accident ...

Perhaps a sworn statement along with a disturbing the peace
complaint -- accompanied with the license plate and detailed
description of the driver might be a wiser alternative?

K1YP

Source record: 110052

Greetings,
There was a club in Kansas or Nebraska that was selling magnetic Skywarn signs for vehicles to benefit their club. Does anyone know what club it was or how to get a hold of them.
Thanks,
Gerry

Try 14,302.5 on 20 meters. There are around 400 truckers that check in from time to time. We make contact and have personal meets when time and schedules allow. I have met many other amateur operators in this manner. There are both solo and husband/wife teams out there. Good luck and have fun. May be back out there some time after I get out of Calif. and back to Arkansas.

2202. Radio Room Spring Cleaning

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-24 00:00:00 UTC
From: Bill <m6rf@yahoo.com>
Message-ID: <372274FC.1FF7@yahoo.com>
Source record: 110055

.. ..

I am doing my spring cleaning in the radio room, and I have the following items for sale. TERMS: The terms are, the first person with the money gets the item (sorry to have to do it this way, but in the past some people have not sent the checks that they promissed to). If need be I can accept Visa, MasterCard, and American Express and run it through the company account.

PRIORITY WILL BE GIVEN to those having any old Leica, Rollei, Alpa, or Voightlander camera equipment to trade. They will have first chance through midnight Monday April 26. However, you can put your name in anytime.

The prices are really pretty firm. All prices are plus shipping. I live in the Denver area (mountain time zone).

My phone number is: 303-674-0510
My e-mail address is: m6rf@yahoo.com

1) Yaesu FL2100B HF amplifier. 10 through 80 meters. Output is 1,200W pep, 1,000W CW, 600W AM. Virtually mint condition with manual. This you will need to pick up or if you are in the Denver area maybe I can deliver it. $350.

2) VoCom 100W 2 meter 12VDC amp. It requires 2 watts in to get the full 100W out. I have not had this on the air for at least 10 years, maybe more. I assume it still works. Mint condition with the manual. $30.

3) Shure 444 mic. Mint condition. Grey. $15.

4) MFJ model 901 antenna tuner. This is a 100W to 200W model for coax, wire, or balanced line inputs. Mint condition. $25.

5) Heath (you remember them) model IM-2400 digital frequency counter. 500Hz to 512MHz. Two time bases .1 sec and 1.0 sec. With the special antenna. Needs battery pack repair (AA type battery). Very nice counter. $25.

6) Brandes Navy Type. Matched tone. Head phones. These are early WWII or earlier (so they are at least 60 years-old). They have the cloth across the head bands. They are stamped "PAT. MAR 13 1923". They are in quite good condition. $25.

7) ICOM mobile hand mic. Dynamic Imp 600 ohms. Condition unknown. $5.

8) Kenwood mobile hand mic. Dymanic, Imp 500 ohms, "UP-DOWN" switches on top. Six pin connector. Mint condition, if not NEW. $10.

9) B&W model 593 antenna switch. This has three imputs. $15.

10) Daiwa model CS-201 antenna switch. This has two imputs. This can be wall mounted or has rubber feet for use on a desk. Virtually NEW. $15.

11) MFJ model 262; 1,000 dry dummy load. Mint. $10.

12) Two old radio handbooks. One is a 1972 ARRL soft cover good condition. The second is the 11th edition, Copyright 1947, of The Radio Handbook by Editors and Engineers, LTD. This is a hard cover book which is also in quite good condition. You get both for $35.

13) Pulser shortwave radio. This is the small portable type that will run on 110vac with a power adapter (included) or batteries (not included). It is about 7 1/4" by 4 1/2". Digital display, clock, AM, FM, SW1 band from 3.2 to 7.3MHz, SW2 band from 9.5 to 21.75MHz. $15.

14) Kamtronics Kam all mode converter for RTTY, CW, etc. For use with your computer or terminal and HF rig. Good condition. The last time I used it (maybe 10 years ago) it worked. $10.

15) Kenwood model SP-230 external speaker. This has a switch for two inputs, plus low, high1, and high2 filters. Mint. $40.

16) Yeasu MD-1 Dynamic desk mic. This has the UP-DOWN buttons, P.T.T. and LOCK switches. Plus three position tone switch and selectable imdenance of 600 ohms or 50K ohms. Mint. $40.

17) ICOM model IC-HM10, mobile mic. This has the UP-DOWM and search functions. Dynamic type. Absolutely NEW, factory boxed, still in plastic. $10.

18) Belden RG-8 coax. Belden number 8237. About 75 feet (that's a guess there is probably more) This is

brand new, low loss foam core with stranded center conductor. $35 (that's about .46 cents a foot).

19) 4 two meter Rubber Duck antennas. 4 1/2" long with a BNC connector. Brand NEW. $5 each or $15 for all 4.

20) Heath (you remember them) model GD-1B grid dip meter. This is a jewel. Its probably 1950s vintage TUBE TYPE, 115VAC genuine Heathkit. I have the coil box with ALL 5 COILS 37 to 100 MC, 14 to 37 MC, 2 to 5 MC, 5 to 15 MC, and 100 to 250 MC. The unit appears to be in working order, but I can not guarantee that. All things considered, this is in very good condition. The purple coil box is faded and water stained in spots. $50.

That is the list. I believe the amplifiers to be in good working order, but for obvious reasons I can not guarantee that.

73's,
Bill

2203. Good FM Antenna Installer in Philadelphia

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-24 00:00:00 UTC
From: james_mitchell@my-dejanews.com
Message-ID: <7fr31u$sp1$1@nnrp1.dejanews.com>
Source record: 110116

I'm located in a house in center city Philadelphia, PA. We cannot receive the only decent classical music station in the city (107.9FM with a very weak signal). Since we can get it on a car radio outside it seems as though we ought to be able to install an antenna on our roof that would do the trick.

Can anyone recommend an individual or company who will do a good job in this sort of situation

2207. FS: SX-62 / 42 Parts, knobs, etc.

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-24 00:00:00 UTC
From: k6sde@my-dejanews.com
Message-ID: <7fra43$2i7$1@nnrp1.dejanews.com>
Source record: 110120

I have an SX-62A parts receiver. (Some parts are also usable on the SX-42 I'm told.)

I have been asked about **KNOBS** by many people. I had thought that I had a chance to do a trade which would get me the SX-101 style knob that I need for the band switch on my rebuilt SX-62A (large knob) but that seems to have fallen through so I'm not waiting longer to offer them.

I have a complete set of the fluted knobs. (But NO POINTER RESET KNOB!) I will entertain OFFERS that will put these knobs to use to help a "needy" SX-62 receiver to become complete. I will give preference to an offer that also gets me the SX-101 knob that I need to make my restored SX-62A complete. I will make an attempt to get as many SX-62s back in original shape if I can by having the knobs go to needy homes so please understand and don't get frustrated if I seem reluctant to immediately sell the entire set of knobs to you. Let's give an opportunity to those who only check their mail a few times a week!

Here's a picture of the entire knob set. It has been sharpened and adjusted so it shows the blemishes more clearly and does make them look worse than they are I think. No work has been done to try to polish and clean the knobs or skirts and one of the skirts with the 0 to 10 scale has been squashed as a result of poor packing when the receiver was shipped to me. The knob itself is OK and perhaps the skirt can be restored but at least the 0 to 10 skirt on it is more generic and probably easier to find than some of the other skirts. This is a fairly large image file to try to retain the detail so it'll take a bit of time to view it. (80 K or so)

http://www.geocities.com:80/Heartland/Ridge/7463/sx62/sx62allknobs2.jpg

Here's a much smaller file with only a few of the knobs in a different view.

http://www.geocities.com:80/Heartland/Ridge/7463/sx62/knobsidex.jpg

---
The following have ALREADY GONE TO NEEDY HOMES:

* Front panel
* Bezel
* dial scale glass
* cover glass for dial scale
* left side sheet metal with pointer reset shaft
* dial pointer
* dial pointer track across top (L shaped aluminum bar)
* 1st, 2nd & 3rd IF coils

* case

I have most of the rest of the receiver so if you need specific parts,
ASK.

Let's hope that this makes it possible for some SX-62 (SX-42?) receivers
to spring back to life!

Ian, K6SDE
San Jose, CA area

I have two NOS tubes of this variety in the original Eimac Boxes. They've never been mounted. Price is $200 ea. or both for $375. Description below is from the Eimac book.

73,

Butch Butler kf4sag
Mt. Pleasant, SC

The Y-739, a planar triode of ceramic/metal construction, is designed for ground and airborne applications. The tube is especially suited in ground Tacan applications where peak powers up to 8KW with a gain of 13dB can be obtained. The tube employs the standard features of a planar triode, such as high current capability from an arc-resistant, extended interface matrix cathode.

CHARACTERISTICS

Plate dissipation: 600W
Grid dissipation: 2.0W
Freq. for MAX Ratings (CW): 1200 MHz
Freq. for MAX Ratings (Pulsed): 2000 MHz
Cooling: Forced Air
Cathode: Oxide-coated Unipotential
Heater Voltage: 6.3V
Heater Current: 2.25A

CAPACITANCES (Grounded Grid)
Grid/Cathode: 14.5pF
Plate/Cathode: 0.1pF
Grid/Plate: 2.1pF

Amplification factor: 175
G,C,H contacts: Special Coaxial
Heater Contact: Special
Maximum Seal & Anode Core Temp: 250°C
Maximum Length: 4.37"; 11.1 cm
Maximum Diameter: 2.6"; 6.6 cm
Weight (Approximate): 1.7 lb.; 0.77 kg
Operating position: Any

TYPICAL OPERATIONS

Class "C" Operation, Grid-pulsed Ampl. or Osc. @1200MHz,
4KV Plate voltage, 3A avg during pulse, duty cycle of 0.01,
Pulse length of 500µs, will result in an output power of 6KW

useful Pulse Power delivered to the load.

Class "C" Operation, Plate-pulsed Ampl. or Osc. @2000MHz,
3.5KV Plate voltage, 10.0A avg during pulse, duty cycle of 0.0033,Pulse
length of 6µs, will result in an output power
of 10KW useful Pulse Power delivered to the load.

2209. FS: NC-125 parts, case, knobs

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-24 00:00:00 UTC
From: k6sde@my-dejanews.com
Message-ID: <7frd5g$506$1@nnrp1.dejanews.com>
Source record: 110122

I have completed restoring my NC-125 and have a parts unit from which I'd sell parts to get your NC-125 back working. I have NO silver bar knobs (had to buy the parts receiver to get them) but have the other knobs. Chassis parts, etc. are available. The parts unit has had a lot of "modifying" done to it but most everything is there.

The cabinet sheet metal is in pretty good shape but would need a repainting to be nice. (I need
to paint the one I'm keeping also!) It's not dented or bent but has the usual scrapes and
scratches on it.

Let me know what you're looking for and I'll see if I have it.

A few of the parts MAY be usable on NC-173/183 series receivers but I'm not positive about
that. It seems as though I've seen some of those receivers with the same S-meter for example.

Let's keep the NC-125 working!!!!

I have several VHF and UHF Motorola Maxar radios for sale.

The VHF radios are 25 watt radios. All radios are two (2) channels; and come complete with radio, mic, heavy duty locking bracket, and power cord.

You will need to purchase the crystals for your favorite frequencies, and have the radios tuned to your specs.

Radios do include a PL reed, already installed.

VHF radios are $25.00 + $10.00 shipping.
UHF radios are $35.00 + $10.00 shipping.

Shipping is USPS Priority Mail. Radios are in great condition.

Going fast, but still several left. Respond to hutch@jerrylee.com for immediate shipment.

Thanks,

Eric - N8XHP

FS a classic Astro 200 80-10 meter 100 watt digiatlly scan tuned ssb/cw transceiver. Have all documents. Rig is in very good condition and it is very small for its age and could be used mobile as well. The vfo control is PLL and tunes with up-down buttons on the front panel or microphone ie fast or slow. Rig also has 500hz cw filter. The alignment was recently checked as well as new voltage regulators have been installed. Asking $300 shipped via UPS.
Thanks

What radio are you talking about here?
My TH-G71A will not work on both bands at once, it only has one RF section!

It will scan all bands, because you can program any freq in any memory
channel, but you can't monitor two channels at once.

HTH,
bb (KE6GWF)
http://www.angelfire.com/ca/ke6gwf (Full mods for the TH-G71A)

I may be getting some 3/4 or7/8 inch hard line that is 75 ohms. I remember reading a article about using 75 ohm line. The author only did test up to 2 meters. I want to use this line on 70 cm. Will cotangent transformers work for this band? I have heard if everything else is good you would only get a 1.5 to 1 match any how. Also do I have to mess with the antenna? I would like to use this at a 440 repeater site and the antenna is a 4 dipole array. Is there any one that sells matching transformers?

Any help?

Mike

" I just got my FT100 yesterday and can't find a fault with anything".

Well good for you, I am so happy for you. That just makes my day. Did you sleep with it under your pillow last night?

So now you have a new little baby FT100, by the way, what did you name your new little FT100 ? I am so sick of all these stupid hams that treat their radios like it is one of their children. Whenever they read a negative post on one of the news groups they take it personally. I am so happy that you have a perfect cute little FT100 ! The fact remains that the receiver on my FT100 on VHF and UHF is DEAD. I stated in the original post that the receiver was dead. It was not only the S-Meter reading but it was the actual quality of the receive coming out of the speaker. There was white noise on local repeaters. Would you keep a new radio that gave a S-9 signal on a repeater that was about 2 miles away ? If you would, you must not expect much for your $1350.00.

> Thanks for all of the people that sent intelligent responces to me
> regarding my original post about the problem with the recieve on my
> FT100. I talked with Yaesu and they said that their is a definite problem
> with the reciever. I sent it back for replacement.

For some of you who just bought a new FT100, I am so sorry if these posts have upset you in any way. I know how traumatic it can be foe some Hams to read bad things about their new children, I mean radios.

73,

Jim N5JIM

FT-10/40R FEATURES

ï¿½ A16D 16 Key DTMF with DCS enc/dec, CTCSS enc/dec, ARTS, 99 Channels.
ï¿½ MIL-STD 810 Rated
ï¿½ Full 5 watt
ï¿½ Battery Charger for all size batteries compatible with FT-10R
ï¿½ Auto Range Transpond System (ARTS), This new system alerts you visually and audibly when a companion handheld is out of simplex range. A built-in CW ID is also included.
ï¿½ High Output Audio High technology speaker design produces higher output even with it's compact design.
ï¿½ Alpha-Numeric Display 4 Character Alpha Name can be used to name your memory channels.
ï¿½ Digital Coded Squelch Included to allow quiet monitoring of busy channels.
ï¿½ Direct FM Improves packet performance and voice quality.
ï¿½ Dual Watch, Allows you to monitor an in-band sub channel for activity.
ï¿½ High Speed Scanning.
ï¿½ Top Notch multifunction control knob.
ï¿½ RX / TX Battery Savers, The FT-10/40R includes both transmit and receive battery savers for maximum battery life.
ï¿½ Omni Glow Backlit LCD Display.
ï¿½ 4 Power Output Levels, Low 1, Low 2, Low 3 and High Power levels are selectable to extend battery life.

What I have for sale:
(2) FT-10R A16D 16Key Radios w/ AC Adapter
(2) MH-34B4B: Speaker Microphone
(2) E-DC-5B: DC Adap. w/Noise Filter
(2) CN-2: Antenna BNC - to - SMA Adapter

Extras
ADMS-1B PC Programming Software allows quick and easy programming with your PC including data cable
Rubber rap around cover
Foam padded full cover with belt loop

The average price I have seen these radios for sale is $350.
I will sell the radio, speaker mike, AC and DC adapter, and SMA-BNC adapter as a package deal for $250. If you want any of the extras, make me an offer.
Remember, I have two sets of these. If anyone wants everything above, make me an offer.
These are very lightly used radios. I am selling because we don't use

them nearly as much since we have mobile radios in the cars.

Please email tfh@primenet.com with any questions or offers.

ZD Engineering sells transformers for most types of CATV hardline.
They work fine, and also serve as substitutes for the often expensive
hardline connectors. The address I have is 605 Balsley Avenue,
Findlay Ohio, 45840. The phone number is 419-424-8765. ZD
Engineering is owned by Paul Darwactor W8ZD. I've used these
transformers and can recomend them.

(It has been some years since I've bought any. I can't guarantee
that the address and phone number are still good, but it is the
best info I have.)

Since the SWR isn't really that high, and excess SWR loss is
relatively low, the question of why should we care is relevant.
The reason is that the reactive termination can *detune your
duplexer*. This leads to desense problems.

You can work around that in a couple of ways (absorb the reactance
into the tuning of the duplexer, or cut the line to a multiple of a halfwave,
remembering velocity factor), but it is generally better to match the
system up as best you can so you can freely interchange parts without
having to retune the entire system. A pair of these transformers are
useful for doing that. (You still have to get your antenna tuned correctly,
or you'll have SWR on the line anyway.)

I think you forgot to figure in the electrical propagation charteristics of
the feedline.
It is likley you will find a 1/4 wave times .66 to get a closer value.
Thats if I remember correctly and you use a feedline with .66 VF.

2259. ADMS-1E Problem

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-25 00:00:00 UTC
From: Michael Blake <k9jri@worldnet.att.net>
Message-ID: <7fvk6skgn1@bgtnsc03.worldnet.att.net>
Source record: 109886

I purchased a copy of Yaesu (RT Systems) ADMS-1E, version 2, yesterday (4/25/99) from the Ham Station. The programming cable did not work with my new VX5R. As I had a second cable available I compared the two and found that the new cable was assembled incorrectly.

Resistor R5 (schematic available on web) is 470K on the schematic and in the working cable but was a 100K resistor in the new cable. Changing this surface mount resistor from 100K to 470K resolved the problem.

I will copy this to RT Systems and the Ham Station so that they will be aware of of this problem. If you have one that does not work it may well be the same problem. The surface mount component "stuffer" was probably loaded with the incorrect part.

Absolutely correct.... but I was not commenting on electrical Vs mechanical
length. Only on 1/4 vs 1/2 wave. You must take into consideration the
propagation factor (typically 0.66 for lots of cable) to go from electrical
to mechanical size. Good comment.

0.66 applies only to solid polyethylthene lines of any
impedance.

If foam-filled or expanded, or disk-supported, with air
space, then a higher VF will apply. Could be as high as
0.94.

: Yes, you can scan both sides mix and match.
:
: I have a new G71a with rapid charger and a extra battery with soft case for
: only 350.00
: N9YCE

YES YES YES!!!! YEAH!!! WHOO HOO!!!!!! I just bought one of
these radios from Denver Radio in PA. Should be here Thursday
and I had that EXACT SAME QUESTION. THANK YOU all for answering
it... And I am very pleased that Kenwood put forth the thought
to allow that. Now this means I'll be able to mix and match my
vhf and uhf and 800mhz stuff and scan all together. As for being
only able to transmit on either vhf or uhf at a time, is ok for
me, since only vhf repeaters are in my area, everything else would
be just to monitor, police, fire, ems, security, etc.

I bought a Yaesu VX1R hoping I could scan between the different
bands and it doesn't, so I'm a little displeased with it, but you
guys who answered yes to the question have made my day...

Speaking of which, www.kenwood.net has the document on their ftp
server for modifying the radio to extend the reception range into
the 800~900mHz range, and its a very easy mod too..

The ICOM IC-271H operates 2 meters FM, SSB and CW. This is the high power version with up to 100 watts output! This radio is considered as the standard of comparison in all mode VHF transceivers and is great for working locally, repeaters, DX and satalites. It includes 32 frequency/mode/offset/tone memories, built-in PL tones, scanning, adjustable tunning speeds, RIT, all-mode squelch and tone control. Output power is adjustable from 10 to 100 watts output. 12 vdc operation. Frequency coverage is 143.8-148.2 Mhz. Hand mike, power cord and manual are included. Mint condition physically and operational. Picture available on request.

I have a virtually new FT-736R with both 6M and 1.2GHz modules installed.
Orignial owner, purchased about a year ago, one of the last. Absolute mint
condition and perfect operating condition -- used little. Also has FM CTCSS
module installed. To be sold only as complete unit as listed -- the ultimate
in VHF/UHF/satt radios. Serious buyers only please! Asking $2000 (original
discounted retail more than $3000) and has both the owner and service
manuals. - dont want to sell, there will never be another VHF/UHF box like
the 736R but cannot keep the investment waiting for Phase 3D.
Expanding shack in other areas. Free 16 element yagi (commercial) with
purchase!! ($100 original cost).
Contact Bob / N6MTU / email: magill@ix.netcom.com --- will call and discuss
with serious buyers.

This dual band mobile has a couple of unique features I like.

But does anyone know if it's roughly in the same quality and feature category as the Kenwood V7A and Yaesu 8100? (Its price indicates that it is.)

>I bought a Yaesu VX1R hoping I could scan between the different
>bands and it doesn't, so I'm a little displeased with it, but you
>guys who answered yes to the question have made my day...

Yeah, that's pretty weird. The FT-50, which is older than the VX-1,
lets you store frequencies from any band in any order in memories and
scan them. From what I've read of the VX-5, which is newer than the VX-1,
it will also do this. So the VX-1 is just strange.

Dave

2279. Using Astron RS-20A with Icom IC-746 - Problem

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-25 00:00:00 UTC
From: Marv Luse <mwluse@dimensional.com>
Message-ID: <3723ACB4.388285F7@dimensional.com>
Source record: 109906

Hello,

I've been using an RS-20A power supply with my 746 and several times now I've had the 746 go dead in the middle of a QSO. Recycling the RS-20A off and on seems to fix the problem. Has anyone experienced a similar problem? Any thoughts as to what might be the cause?

Thanks and 73,

Marv

Just about all current production vhf/uhf mobile radios
come with the same 2 pin flat bladed connector. This
connector has the 2 flat pins at right angles to each
other. I have 2 vehicles that I would like to share
with a single mobile transceiver. I took the connector
to auto parts stores and they weren't able to help me.
Then I tried Tech America to no avail. Ditto for the
Digikey and Allied catalogs. Can someone help me with
a manufacturer/part number or a source for the connector.

Thanks in advance,
Larry Benko, AC0B

Marv:

I am using an Astron SS25M with my IC-746 and have not experienced this problem... but I have 5 more amps of supply than you do. I do notice that the rig peaks to 20 amps on transmit, so you may be seeing the supply go into current-limiting.

2290. FS: Yaesu FT-920 w/Inrad filters & switch kit

Newsgroup: rec.radio.amateur.equipment
Date: 1999-04-25 00:00:00 UTC
From: Guy Atkins <think.dx@mindspring.com>
Message-ID: <7g0qt5con1@nntp8.atl.mindspring.net>
Source record: 109917
Cross-posted to: rec.radio.amateur.equipment,rec.radio.swap

This is a rather unique used FT-920, because the transmitter portion has NEVER been operated or keyed. I'm a SWBC & foreign mediumwave DXer and was just interested in the rcvr section. Includes orig. box, manual, hand mic in unopened box, Yaesu FT-920 videotape, DC power cord, INRAD 1.8 kHz (SSB) crystal filter, INRAD 6.0 kHz (AM) crystal filter, and INRAD's new filter switch kit. (No FM unit, however.)

The switch kit is production ser. #001, and it works great to allow both the 2.4 stock Yaesu and INRAD's 1.8 filter to be used on SSB. George at International Radio specially prepared this switch kit for use on a DXpedition, before the official public release of the product. See http://www.qth.com/inrad for details on these aftermarket filters.

Less than 50 hours use (2 DXpeditions) on this like-new FT-920. $1200 for all. Contact me for details, references, etc

I'm a fairly new ham like yourself but sounds an awful lot like a
quickie alignment... Can't imagine it costing you more than an hr
labor... just a guess, am not a tech. You might email a place such as
AES [Amateur Electronic Supply - they have an internet web page] and
describe the symptoms and request an estimate - they service kenwood
also.
